E. Analog Devices Inc./Maxim Integrated - <u>ZLP32300P2816G Datasheet</u>

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

Details

Detalls	
Product Status	Discontinued at Digi-Key
Core Processor	Z8
Core Size	8-Bit
Speed	8MHz
Connectivity	
Peripherals	Brown-out Detect/Reset, HLVD, POR, WDT
Number of I/O	24
Program Memory Size	16KB (16K x 8)
Program Memory Type	OTP
EEPROM Size	
RAM Size	237 x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 3.6V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Through Hole
Package / Case	28-DIP (0.600", 15.24mm)
Supplier Device Package	28-PDIP
Purchase URL	https://www.e-xfl.com/product-detail/analog-devices/zlp32300p2816g

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

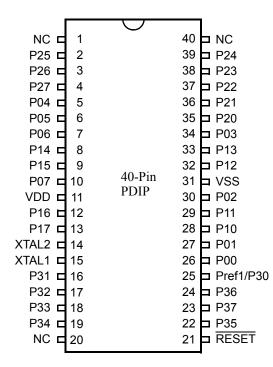

Figure 5. 40-Pin PDIP Pin Configuration

Port 2 (P27-P20)

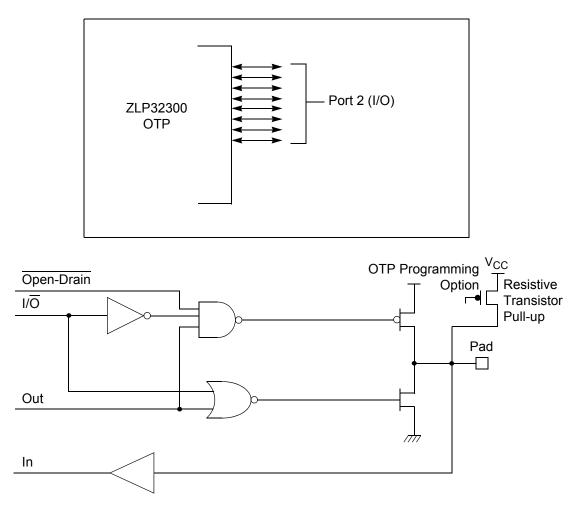

Port 2 is an 8-bit, bidirectional, CMOS-compatible I/O port (see Figure 9). These eight I/O lines can be independently configured under software control as inputs or outputs. Port 2 is always available for I/O operation. A EPROM option bit is available to connect eight pull-up transistors on this port. Bits programmed as outputs are globally programmed as either push-pull or open-drain. The POR resets with the eight bits of Port 2 configured as inputs.

Port 2 also has an 8-bit input OR and AND gate, which can be used to wake up the part. P20 can be programmed to access the edge-detection circuitry in DEMODULATION mode.

Crimzon[®] ZLP32300 Product Specification

zilog

Port 3 (P37-P30)

Port 3 is a 8-bit, CMOS-compatible fixed I/O port (see Figure 10). Port 3 consists of four fixed input (P33–P30) and four fixed output (P37–P34), which can be configured under software control for interrupt and as output from the counter/timers. P30, P31, P32, and P33 are standard CMOS inputs; P34, P35, P36, and P37 are push-pull outputs.

Location of 3	2768	Not Accessible

	2	IRQ1
	1	IRQ0
	0	IRQ0

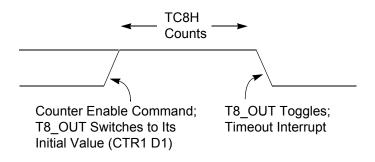

Expanded Register File

The register file has been expanded to allow for additional system control registers and for mapping of additional peripheral devices into the register address area. The Z8 register address space (R0 through R15) has been implemented as 16 banks, with 16 registers per bank. These register groups are known as the ERF (Expanded Register File). Bits 7–4 of

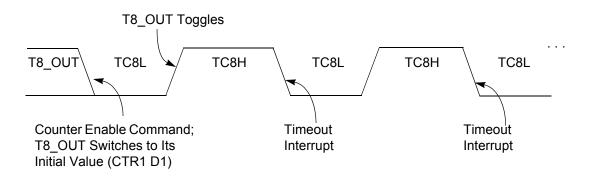

Caution: Using the same instructions for stopping the counter/timers and setting the status bits is not recommended.

Two successive commands are necessary. First, the counter/timers must be stopped. Second, the status bits must be reset. These commands are required because it takes one counter/timer clock interval for the initiated event to actually occur, see Figure 19 and Figure 20.

T8 DEMODULATION Mode

You must program TC8L and TC8H to FFh. After T8 is enabled, when the first edge (rising, falling, or both depending on CTR1, D5; D4) is detected, it starts to count down. When a subsequent edge (rising, falling, or both depending on CTR1, D5; D4) is detected during counting, the current value of T8 is complemented and put into one of the capture registers. If it is a positive edge, data is put into LO8; if it is a negative edge, data is put into HI8. From that point, one of the edge detect status bits (CTR1, D1; D0) is set, and an interrupt can be generated if enabled (CTR0, D2). Meanwhile, T8 is loaded with FFh and starts counting again. If T8 reaches 0, the time-out status bit (CTR0, D5) is set, and an

Crimzon[®] ZLP32300 **Product Specification** zilog Do not load these registers at the time the values are to be loaded into the counter/timer Caution: to ensure known operation. An initial count of 1 is not allowed. An initial count of 0causes T16 to count from 0 to FFFFh to FFFFh. Transition from 0 to FFFFh is not a timeout condition. -TC16H*256+TC16L Counts "Counter Enable" Command T16 OUT Toggles, T16 OUT Switches to Its Timeout Interrupt Initial Value (CTR1 D0) Figure 24. T16 OUT in SINGLE-PASS Mode TC16H*256+TC16L TC16H*256+TC16L

Figure 25. T16_OUT in MODULO-N Mode

T16 DEMODULATION Mode

You must program TC16L and TC16H to FFh. After T16 is enabled, and the first edge (rising, falling, or both depending on CTR1 D5; D4) is detected, T16 captures H116 and LO16, reloads, and begins counting.

If D6 of CTR2 Is 0

When a subsequent edge (rising, falling, or both depending on CTR1, D5; D4) is detected during counting, the current count in T16 is complemented and put into HI16 and LO16. When data is captured, one of the edge detect status bits (CTR1, D1; D0) is set, and an interrupt is generated if enabled (CTR2, D2). T16 is loaded with FFFFh and starts again.

counter/timers (see Table 11 on page 45) and one for low-voltage detection. The Interrupt Mask Register (globally or individually) enables or disables the six interrupt requests.

The source for IRQ is determined by bit 1 of the Port 3 mode register (P3M). When in DIGITAL mode, Pin P33 is the source. When in ANALOG mode, the output of the Stop Mode Recovery source logic is used as the source for the interrupt, see Figure 33 on page 52.

Figure 28. Interrupt Block Diagram

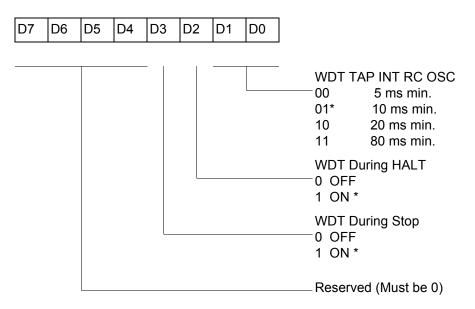

Watchdog Timer Mode

Watchdog Timer Mode Register (WDTMR)

The Watchdog Timer is a retriggerable one-shot timer that resets the $Z8^{\mathbb{R}}$ if it reaches its terminal count. The WDT must initially be enabled by executing the WDT instruction. On subsequent executions of the WDT instruction, the WDT is refreshed. The WDT circuit is driven by an on-board RC-oscillator. The WDT instruction affects the Zero (Z), Sign (S), and Overflow (V) Flags.

The POR clock source the internal RC-oscillator. Bits 0 and 1 of the WDT register control a tap circuit that determines the minimum time-out period. Bit 2 determines whether the WDT is active during HALT, and Bit 3 determines WDT activity during Stop. Bits 4 through 7 are reserved (see Figure 35). This register is accessible only during the first 60 processor cycles (120 XTAL clocks) from the execution of the first instruction after Power-on reset, Watchdog Reset, or a Stop Mode Recovery (see Figure 34). After this point, the register cannot be modified by any means (intentional or otherwise). The WDTMR cannot be read. The register is located in Bank F of the Expanded Register Group at address location 0Fh. It is organized as shown in Figure 35.

WDTMR(0F)0Fh

*Default setting after reset

Figure 35. Watchdog Timer Mode Register (Write Only)

WDT Time Select (D0, D1)

This bit selects the WDT time period. It is configured as indicated in Table 15.

Table 15. Watchdog Timer Time Select

D1	D0	Timeout of Internal RC-Oscillator
0	0	5 ms min
0	1	10 ms min
1	0	20 ms min
1	1	80 ms min

WDTMR During Halt (D2)

This bit determines whether or not the WDT is active during HALT mode. A 1 indicates active during HALT. The default is 1, see Figure 36.

Part Number Description

Zilog[®] part numbers consist of a number of components, as shown below. ZLP32300H2832G is a Crimzon ZLP32300 OTP product in a 28-pin SSOP package, with 32 KB of OTP and built with lead-free solder.
