
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	Z8
Core Size	8-Bit
Speed	8MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, HLVD, POR, WDT
Number of I/O	16
Program Memory Size	32KB (32K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	237 x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 3.6V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SOIC (0.295", 7.50mm Width)
Supplier Device Package	20-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/analog-devices/zlp32300s2032g

Revision History

Each instance in the Revision History table reflects a change to this document from its previous revision. For more details, refer to the corresponding pages or appropriate link in the table.

Date	Revision Level	Description	Page Number
February 2008	23	Updated Ordering Information section.	87
January 2008	22	Updated Ordering Information section.	87
July 2007	21	Updated Disclaimer section and implemented style guide.	All
February 2007	20	Updated Low-Voltage Detection.	58
May 2006	19	Updated Figure 33 with pin P22 in SMR block input.	52
December 2005	18	Updated Clock and Input/Output Ports sections.	15 and 51

Table of Contents

Architectural Overview

Zilog's Crimzon® ZLP32300 is an OTP-based member of the MCU family of infrared microcontrollers. With 237 B of general-purpose RAM and 8 KB to 32 KB of OTP, Zilog's CMOS microcontrollers offer fast-executing, efficient use of memory, sophisticated interrupts, input/output bit manipulation capabilities, automated pulse generation/reception, and internal key-scan pull-up transistors.

The Crimzon ZLP32300 architecture (see Figure 1 on page 3) is based on Zilog's 8-bit microcontroller core with an Expanded Register File allowing access to register-mapped peripherals, input/output (I/O) circuits, and powerful counter/timer circuitry. The Z8® CPU offers a flexible I/O scheme, an efficient register and address space structure, and a number of ancillary features that are useful in many consumer, automotive, computer peripheral, and battery-operated hand-held applications.

There are three basic address spaces available to support a wide range of configurations:

1. Program Memory
2. Register File
3. Expanded Register File

The register file is composed of 256 Bytes of RAM. It includes four I/O port registers, 16 control and status registers, and 236 general-purpose registers. The Expanded Register File consists of two additional register groups (F and D).

To unburden the program from coping with such real-time problems as generating complex waveforms or receiving and demodulating complex waveform/pulses, the Crimzon ZLP32300 offers a new intelligent counter/timer architecture with 8-bit and 16-bit counter/timers (see Figure 2 on page 4). Also included are a large number of user-selectable modes and two on-board comparators to process analog signals with separate reference voltages.

Note: *All signals with an overline, "‾", are active Low. For example, B/$\overline{W}$, in which WORD is active Low, and $\overline{B}$/W, in which BYTE is active Low.*

Power connections use the conventional descriptions listed in Table 1.

Table 1. Power Connections

Connection	Circuit	Device
Power	V_{CC}	V_{DD}
Ground	GND	V_{SS}

Development Features

Table 2 lists the features of Crimzon ZLP32300 family.

Table 2. Crimzon ZLP32300 MCU Features

Device	OTP(KB)	RAM* (Bytes)	I/O Lines	Voltage Range
Crimzon ZLP32300	8, 16, 32	237	32, 24 or 16	2.0–3.6 V
*General purpose				

The additional features include:

- Low power consumption–11 mW (typical)
- Three standby modes:
  - STOP—1.7 µA (typical)
  - HALT—0.6 mA (typical)
  - Low-voltage reset
- Special architecture to automate both generation and reception of complex pulses or signals:
  - One programmable 8-bit counter/timer with two capture registers and two load registers
  - One programmable 16-bit counter/timer with one 16-bit capture register pair and one 16-bit load register pair
  - Programmable input glitch filter for pulse reception
- Six priority interrupts
  - Three external
  - Two assigned to counter/timers
  - One Low-Voltage Detection interrupt
- Low-Voltage Detection and high voltage detection Flags
- Programmable Watchdog Timer/Power-On Reset (WDT/POR) circuits
- Two independent comparators with programmable interrupt polarity
- Programmable EPROM options
  - Port 0: 0–3 pull-up transistors
  - Port 0: 4–7 pull-up transistors
  - Port 1: 0–3 pull-up transistors
  - Port 1: 4–7 pull-up transistors

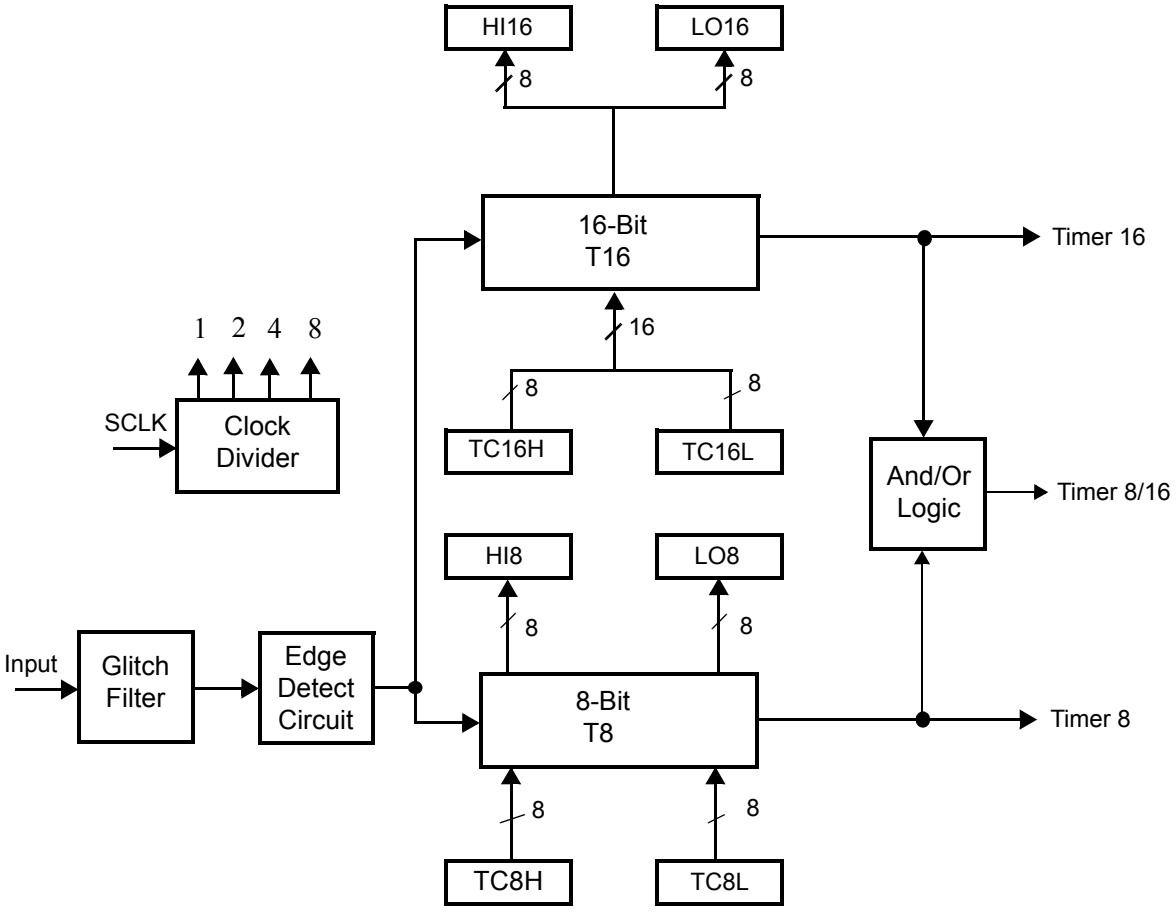

Figure 2. Counter/Timers Diagram

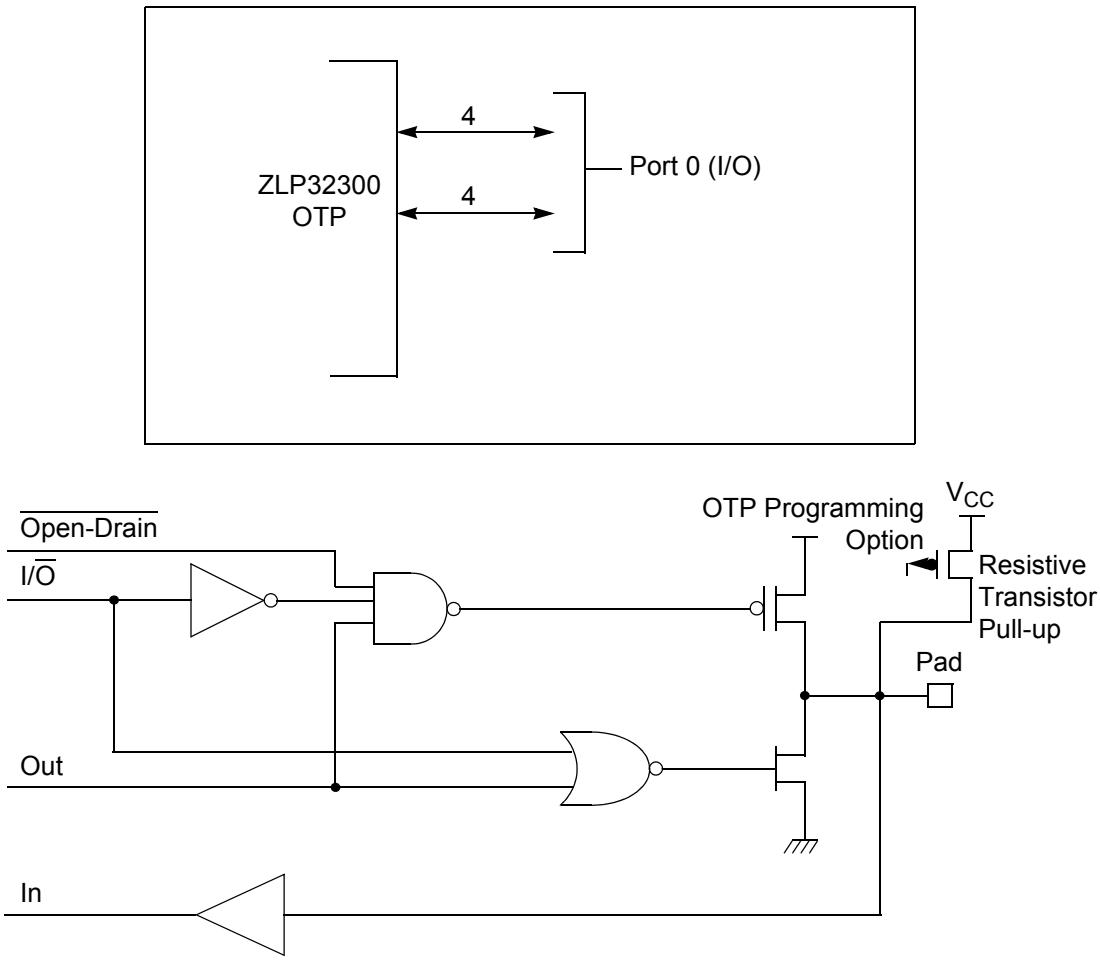

Figure 7. Port 0 Configuration

Port 1 (P17–P10)

Port 1 can be configured for standard port input or output mode (see Figure 8). After POR or Stop Mode Recovery, Port 1 is configured as an input port. The output drivers are either push-pull or open-drain and are controlled by bit D1 in the PCON register.

Notes:
1. *The Port 1 direction is reset to be input following an SMR.*
2. *In 20- and 28-pin packages, Port 1 is reserved. A write to this register will have no effect and will always read FF.*

Functional Description

This device incorporates special functions to enhance the Z8 functionality in consumer and battery-operated applications.

Program Memory

This device addresses 32 KB of OTP memory. The first 12 bytes are reserved for interrupt vectors. These locations contain the six 16-bit vectors that correspond to the six available interrupts. See Figure 12.

RAM

This device features 256 B of RAM.

Caution: *Using the same instructions for stopping the counter/timers and setting the status bits is not recommended.*

Two successive commands are necessary. First, the counter/timers must be stopped. Second, the status bits must be reset. These commands are required because it takes one counter/timer clock interval for the initiated event to actually occur, see Figure 19 and Figure 20.

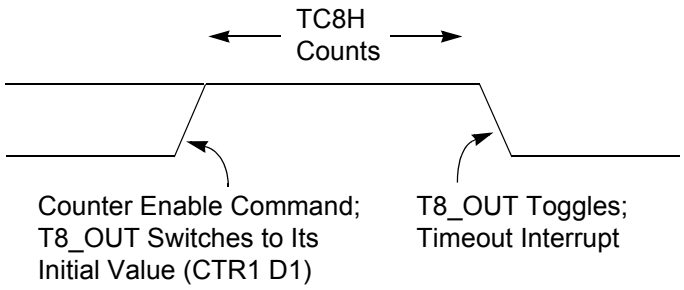

Figure 19. T8_OUT in SINGLE-PASS Mode

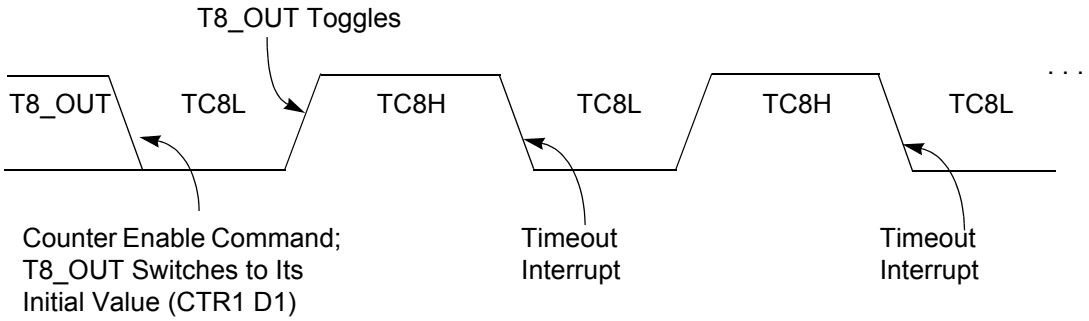

Figure 20. T8_OUT in MODULO-N Mode

T8 DEMODULATION Mode

You must program TC8L and TC8H to FFh. After T8 is enabled, when the first edge (rising, falling, or both depending on CTR1, D5; D4) is detected, it starts to count down. When a subsequent edge (rising, falling, or both depending on CTR1, D5; D4) is detected during counting, the current value of T8 is complemented and put into one of the capture registers. If it is a positive edge, data is put into LO8; if it is a negative edge, data is put into HI8. From that point, one of the edge detect status bits (CTR1, D1; D0) is set, and an interrupt can be generated if enabled (CTR0, D2). Meanwhile, T8 is loaded with FFh and starts counting again. If T8 reaches 0, the time-out status bit (CTR0, D5) is set, and an

Table 11. Interrupt Types, Sources, and Vectors

Name	Source	Vector Location	Comments
IRQ0	P32	0,1	External (P32), Rising, Falling Edge Triggered
IRQ1	P33	2,3	External (P33), Falling Edge Triggered
IRQ2	P31, T_{IN}	4,5	External (P31), Rising, Falling Edge Triggered
IRQ3	T16	6,7	Internal
IRQ4	T8	8,9	Internal
IRQ5	LVD	10,11	Internal

When more than one interrupt is pending, priorities are resolved by a programmable priority encoder controlled by the Interrupt Priority Register. An interrupt machine cycle activates when an interrupt request is granted. As a result, all subsequent interrupts are disabled, and the Program Counter and Status Flags are saved. The cycle then branches to the program memory vector location reserved for that interrupt. All Crimzon ZLP32300 interrupts are vectored through locations in the program memory. This memory location and the next byte contain the 16-bit address of the interrupt service routine for that particular interrupt request. To accommodate polled interrupt systems, interrupt inputs are masked, and the Interrupt Request register is polled to determine which of the interrupt requests require service.

An interrupt resulting from AN1 is mapped into IRQ2, and an interrupt from AN2 is mapped into IRQ0. Interrupts IRQ2 and IRQ0 can be rising, falling, or both edge triggered. These interrupts are programmable. The software can poll to identify the state of the pin.

Programming bits for the Interrupt Edge Select are located in the IRQ Register (R250), bits D7 and D6. The configuration is indicated in Table 12.

Table 12. IRQ Register

IRQ		Interrupt Edge	
D7	**D6**	**IRQ2 (P31)**	**IRQ0 (P32)**
0	0	F	F
0	1	F	R
1	0	R	F
1	1	R/F	R/F

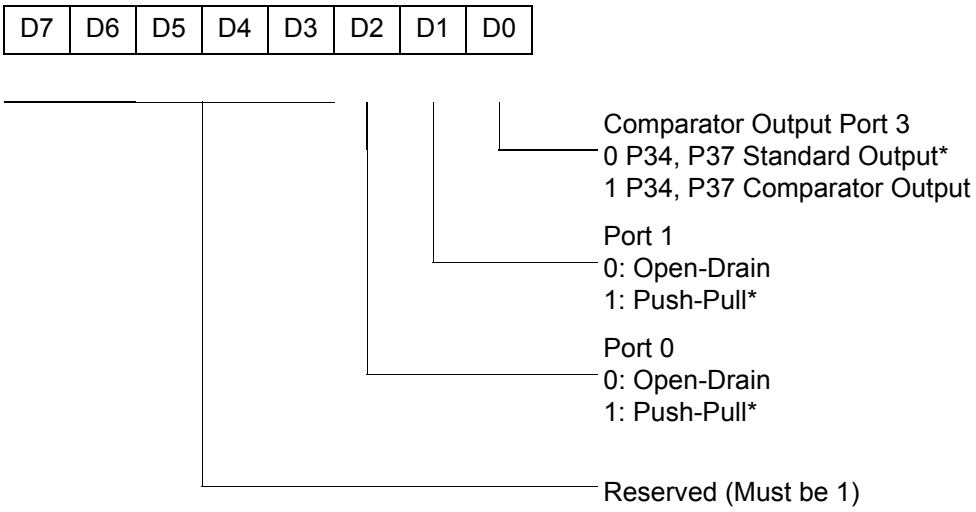
Note: F = Falling Edge; R = Rising Edge

Port Configuration

Port Configuration Register

The Port Configuration (PCON) register (see Figure 30) configures the comparator output on Port 3. It is located in the expanded register 2 at Bank F, location 00.

PCON(FH)00h



* Default setting after reset

Figure 30. Port Configuration Register (PCON) (Write Only)

Comparator Output Port 3 (D0)

Bit 0 controls the comparator used in Port 3. A 1 in this location brings the comparator outputs to P34 and P37, and a 0 releases the Port to its standard I/O configuration.

Port 1 Output Mode (D1)

Bit 1 controls the output mode of Port 1. A 1 in this location sets the output to push-pull, and a 0 sets the output to open-drain.

Port 0 Output Mode (D2)

Bit 2 controls the output mode of Port 0. A 1 in this location sets the output to push-pull, and a 0 sets the output to open-drain.

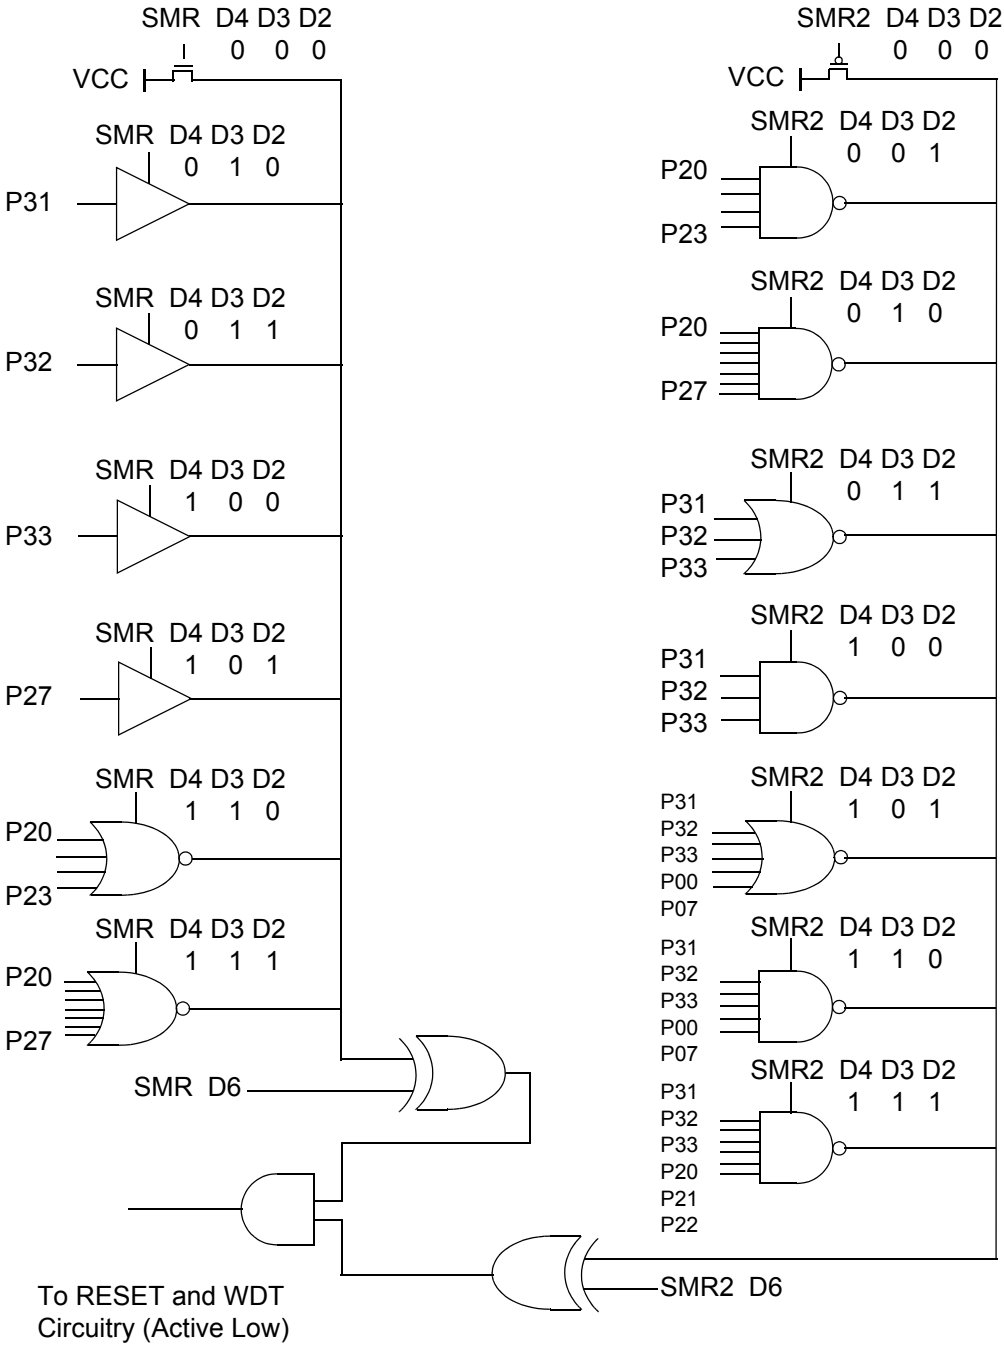


Figure 33. Stop Mode Recovery Source

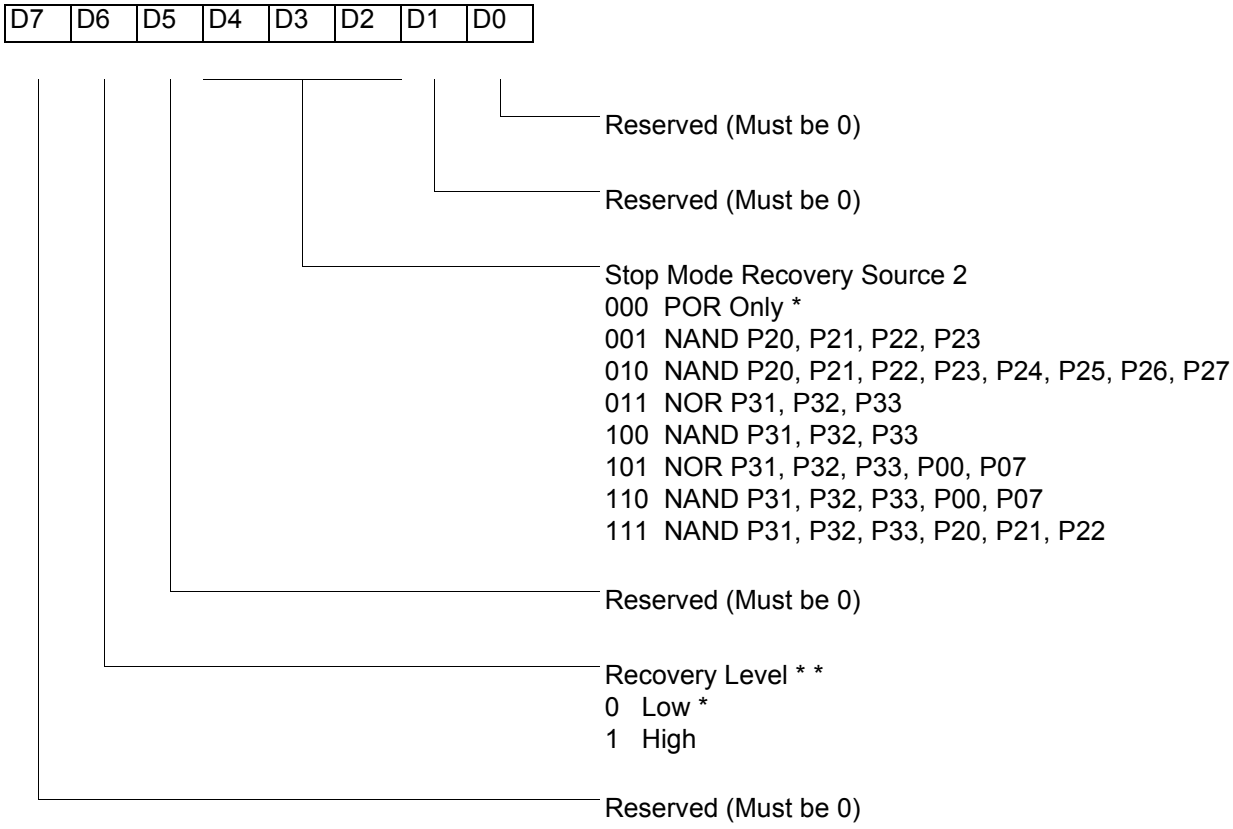
Stop Mode Recovery Register 2 (SMR2)

This register determines the mode of Stop Mode Recovery for SMR2 (see Figure 34).

SMR2(0F)Dh

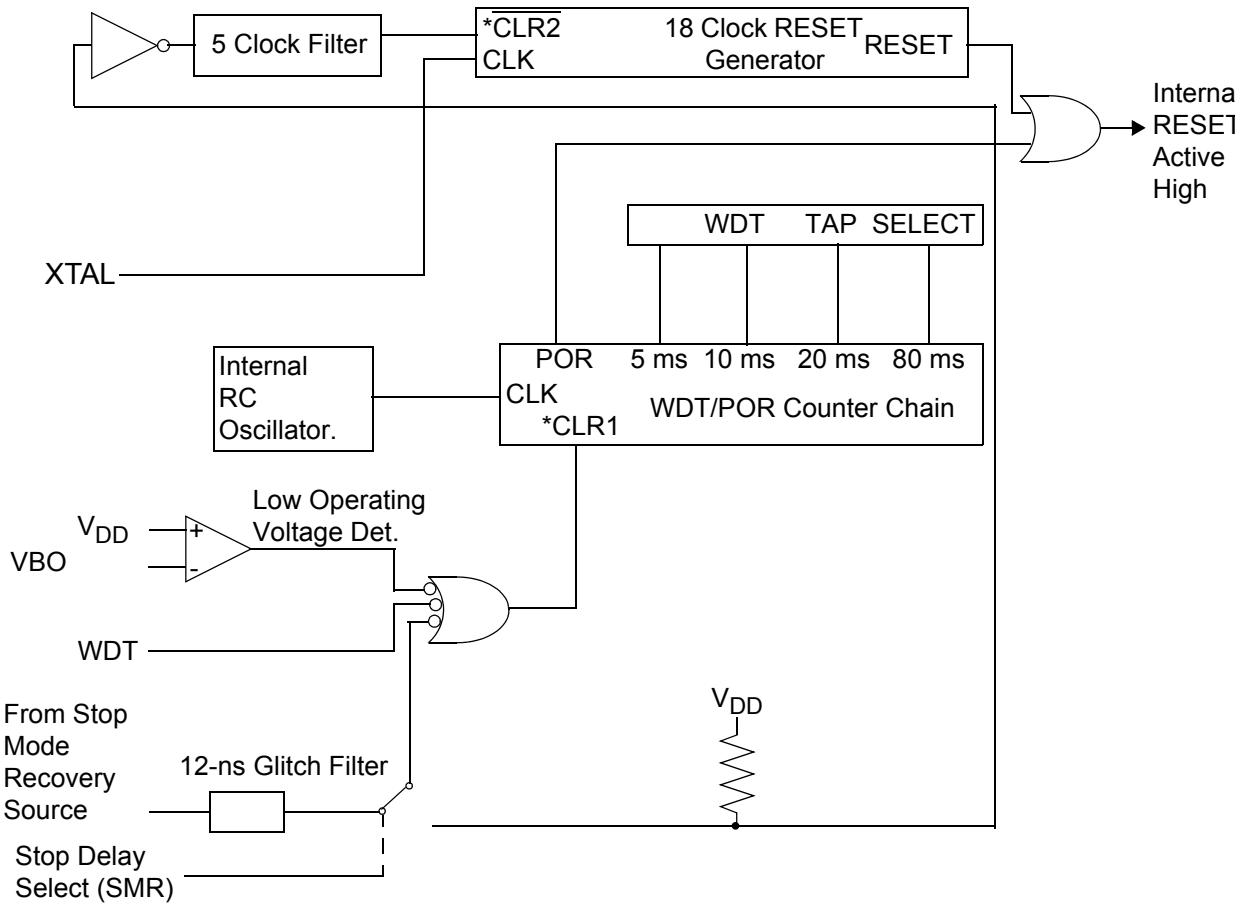


If used in conjunction with SMR, either of the two specified events causes a Stop Mode Recovery.
*Default setting after reset.
* *At the XOR gate input.

Figure 34. Stop Mode Recovery Register 2 ((0F)DH:D2–D4, D6 Write Only)

If SMR2 is used in conjunction with SMR, either of the specified events causes a Stop Mode Recovery.

Note: *Port pins configured as outputs are ignored as an SMR or SMR2 recovery source. For example, if the NAND or P23–P20 is selected as the recovery source and P20 is configured as an output, the remaining SMR pins (P23–P21) form the NAND equation.*



* CLR1 and $\overline{CLR2}$ enable the WDT/POR and 18 Clock Reset timers respectively upon a Low-to-High

Figure 36. Resets and WDT

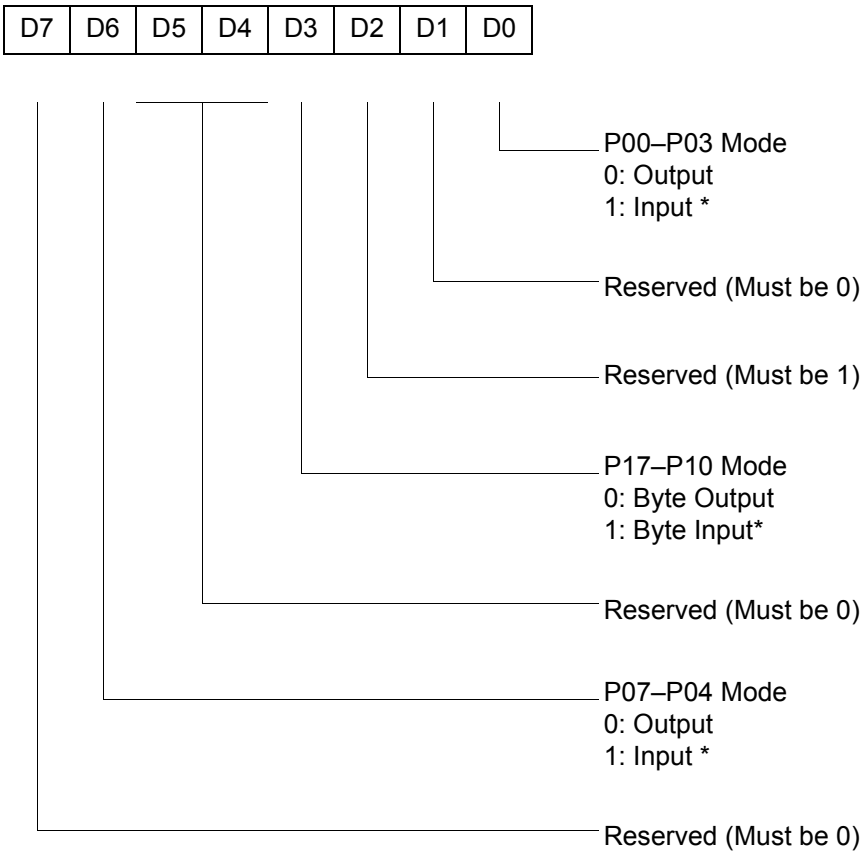
WDTMR During STOP (D3)

This bit determines whether or not the WDT is active during STOP mode. A 1 indicates active during Stop. The default is 1.

EPROM Selectable Options

There are seven EPROM Selectable Options to choose from based on ROM code requirements. These are listed in Table 16.

R248 P01M(F8H)



*Default setting after reset; only P00, P01 and P07 are available on Crimzon ZLP32300 20-pin configurations.

Figure 48. Port 0 and 1 Mode Register (F8H: Write Only)

Capacitance

Table 18 lists the capacitances.

Table 18. Capacitance

Parameter	Maximum
Input capacitance	12 pF
Output capacitance	12 pF
I/O capacitance	12 pF
T_A = 25 °C, V_{CC} = GND = 0 V, f = 1.0 MHz, unmeasured pins returned to GND	

DC Characteristics

Table 19 describes the DC characteristics.

Table 19. DC Characteristics

			T_A= 0 °C to +70 °C					
Symbol	Parameter	V_{CC}	Min	Typ(7)	Max	Units	Conditions	Notes
V_{CC}	Supply Voltage		2.0		3.6	V	See Notes	5
V_{CH}	Clock Input High Voltage	2.0-3.6	0.8 V_{CC}		V_{CC}+0.3	V	Driven by External Clock Generator	
V_{CL}	Clock Input Low Voltage	2.0-3.6	V_{SS}–0.3		0.4	V	Driven by External Clock Generator	
V_{IH}	Input High Voltage	2.0-3.6	0.7 V_{CC}		V_{CC}+0.3	V		
V_{IL}	Input Low Voltage	2.0-3.6	V_{SS}–0.3		0.2 V_{CC}	V		
V_{OH1}	Output High Voltage	2.0-3.6	V_{CC}–0.4			V	I_{OH} = –0.5 mA	
V_{OH2}	Output High Voltage (P36, P37, P00, P01)	2.0-3.6	V_{CC}–0.8			V	I_{OH} = –7 mA	
V_{OL1}	Output Low Voltage	2.0-3.6			0.4	V	I_{OL} = 4.0 mA	
V_{OL2}	Output Low Voltage (P00, P01, P36, P37)	2.0-3.6			0.8	V	I_{OL} = 10 mA	
V_{OFFSET}	Comparator Input Offset Voltage	2.0-3.6			25	mV		
V_{REF}	Comparator Reference Voltage	2.0-3.6	0		V_{CC} -1.75	V		

Table 19. DC Characteristics (Continued)

			T_A= 0 °C to +70 °C					
Symbol	**Parameter**	**V_{CC}**	**Min**	**Typ(7)**	**Max**	**Units**	**Conditions**	**Notes**
I_{IL}	Input Leakage	2.0-3.6	–1		1	µA	V_{IN} = 0 V, V_{CC} Pull-ups disabled	
R_{PU}	Pull-Up Resistance	2.0 3.6	225 75		675 275	kΩ kΩ	V_{IN} = 0 V, Pull-ups selected by mask option	
I_{OL}	Output Leakage	2.0-3.6	–1		1	µA	V_{IN} = 0 V, V_{CC}	
I_{CC}	Supply Current	2.0 3.6		1 5	3 10	mA mA	at 8.0 MHz at 8.0 MHz	1, 2 1, 2
I_{CC1}	Standby Current (HALT Mode)	2.0 3.6		0.5 0.8	1.6 2.0	mA	V_{IN} = 0V, V_{CC} at 8.0 MHz Same as above	1, 2, 6 1, 2, 6

I_{LV}	Standby Current (Low Voltage)			1.2	6	µA	Measured at 1.3 V	4
V_{BO}	V_{CC} Low Voltage Protection			1.9	2.0	V	8 MHz maximum Ext. CLK Freq.	
V_{LVD}	Vcc Low Voltage Detection			2.4		V		
V_{HVD}	Vcc High Voltage Detection			2.7		V		

Notes
1. All outputs unloaded, inputs at rail.
2. CL1 = CL2 = 100 pF.
3. Oscillator stopped.
4. Oscillator stops when V_{CC} falls below V_{BO} limit.
5. It is strongly recommended to add a filter capacitor (minimum 0.1 µF), physically close to VDD and V_{SS} pins if operating voltage fluctuations are anticipated, such as those resulting from driving an infrared LED.
6. Comparator and Timers are on. Interrupt disabled.
7. Typical values shown are at 25 ºC.

Packaging

Package information for all versions of Crimzon ZLP32300 is displayed in Figure 58 through Figure 65.
