
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Discontinued at Digi-Key
Core Processor	Z8
Core Size	8-Bit
Speed	8MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, HLVD, POR, WDT
Number of I/O	24
Program Memory Size	16KB (16K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	237 x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 3.6V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/analog-devices/zlp32300s2816c00tr

Architectural Overview

Zilog's Crimzon® ZLP32300 is an OTP-based member of the MCU family of infrared microcontrollers. With 237 B of general-purpose RAM and 8 KB to 32 KB of OTP, Zilog's CMOS microcontrollers offer fast-executing, efficient use of memory, sophisticated interrupts, input/output bit manipulation capabilities, automated pulse generation/reception, and internal key-scan pull-up transistors.

The Crimzon ZLP32300 architecture (see Figure 1 on page 3) is based on Zilog's 8-bit microcontroller core with an Expanded Register File allowing access to register-mapped peripherals, input/output (I/O) circuits, and powerful counter/timer circuitry. The Z8® CPU offers a flexible I/O scheme, an efficient register and address space structure, and a number of ancillary features that are useful in many consumer, automotive, computer peripheral, and battery-operated hand-held applications.

There are three basic address spaces available to support a wide range of configurations:

1. Program Memory
2. Register File
3. Expanded Register File

The register file is composed of 256 Bytes of RAM. It includes four I/O port registers, 16 control and status registers, and 236 general-purpose registers. The Expanded Register File consists of two additional register groups (F and D).

To unburden the program from coping with such real-time problems as generating complex waveforms or receiving and demodulating complex waveform/pulses, the Crimzon ZLP32300 offers a new intelligent counter/timer architecture with 8-bit and 16-bit counter/timers (see Figure 2 on page 4). Also included are a large number of user-selectable modes and two on-board comparators to process analog signals with separate reference voltages.

Note: *All signals with an overline, "$\overline{\ }$", are active Low. For example, B/$\overline{W}$, in which WORD is active Low, and $\overline{B}$/W, in which BYTE is active Low.*

Power connections use the conventional descriptions listed in Table 1.

Table 1. Power Connections

Connection	Circuit	Device
Power	V_{CC}	V_{DD}
Ground	GND	V_{SS}

Table 5. 40- and 48-Pin Configuration (Continued)

40-Pin PDIP No	48-Pin SSOP No	Symbol
32	39	P12
33	40	P13
8	9	P14

	48	NC
	6	NC

open-drain output with output logic as ONE, it is a floating port and reads back as ZERO. The following instruction sets P00-P07 all Low.

```
AND P0,#%F0
```

Port 0 (P00–P07)

Port 0 is an 8-bit, bidirectional, CMOS-compatible port. These eight I/O lines are configured under software control as a nibble I/O port. The output drivers are push-pull or open-drain controlled by bit D2 in the PCON register.

If one or both nibbles are needed for I/O operation, they must be configured by writing to the Port 01 mode register (P01M). After a hardware reset or Stop Mode Recovery, Port 0 is configured as an input port.

An optional pull-up transistor is available as a OTP option bit on all Port 0 bits with nibble select.

Note: *The Port 0 direction is reset to be input following an SMR.*

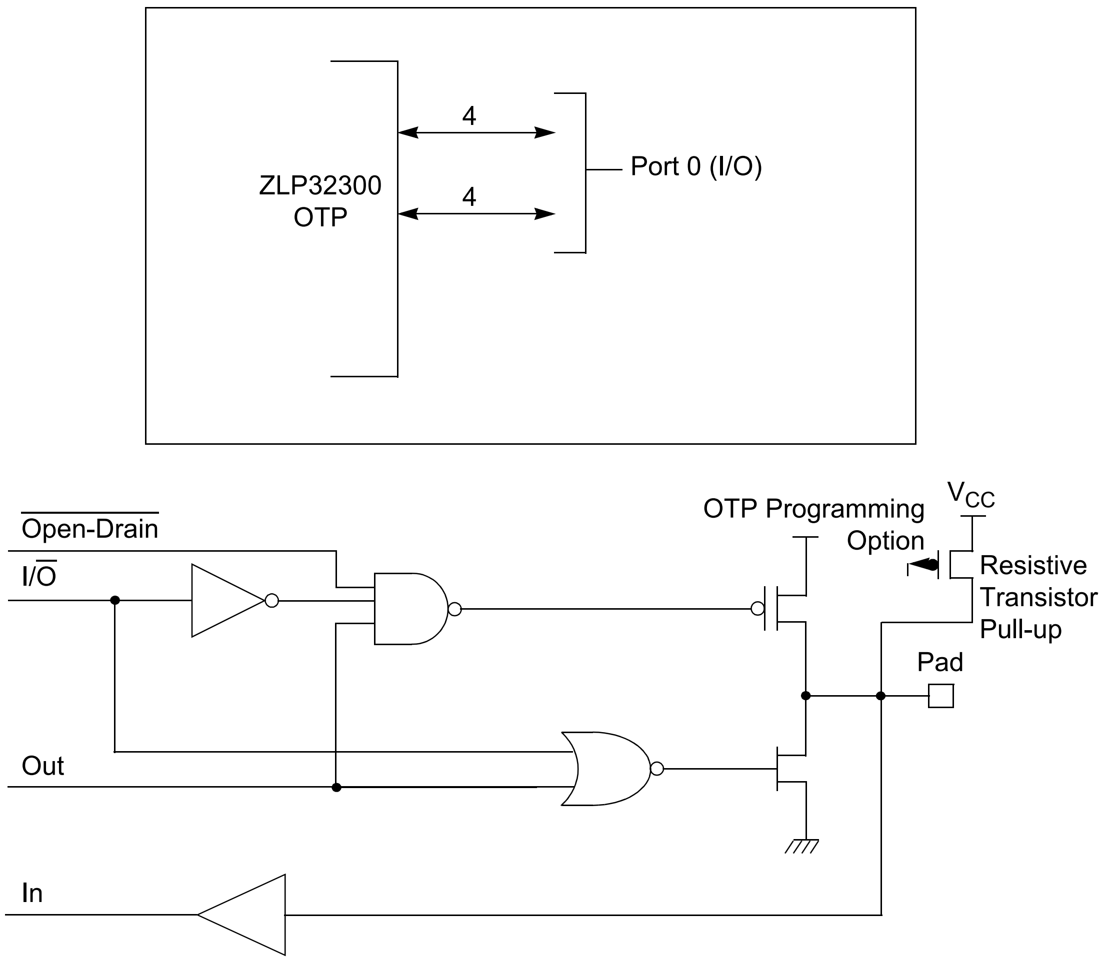

Figure 7. Port 0 Configuration

Port 1 (P17–P10)

Port 1 can be configured for standard port input or output mode (see Figure 8). After POR or Stop Mode Recovery, Port 1 is configured as an input port. The output drivers are either push-pull or open-drain and are controlled by bit D1 in the PCON register.

Notes:
1. *The Port 1 direction is reset to be input following an SMR.*
2. *In 20- and 28-pin packages, Port 1 is reserved. A write to this register will have no effect and will always read FF.*

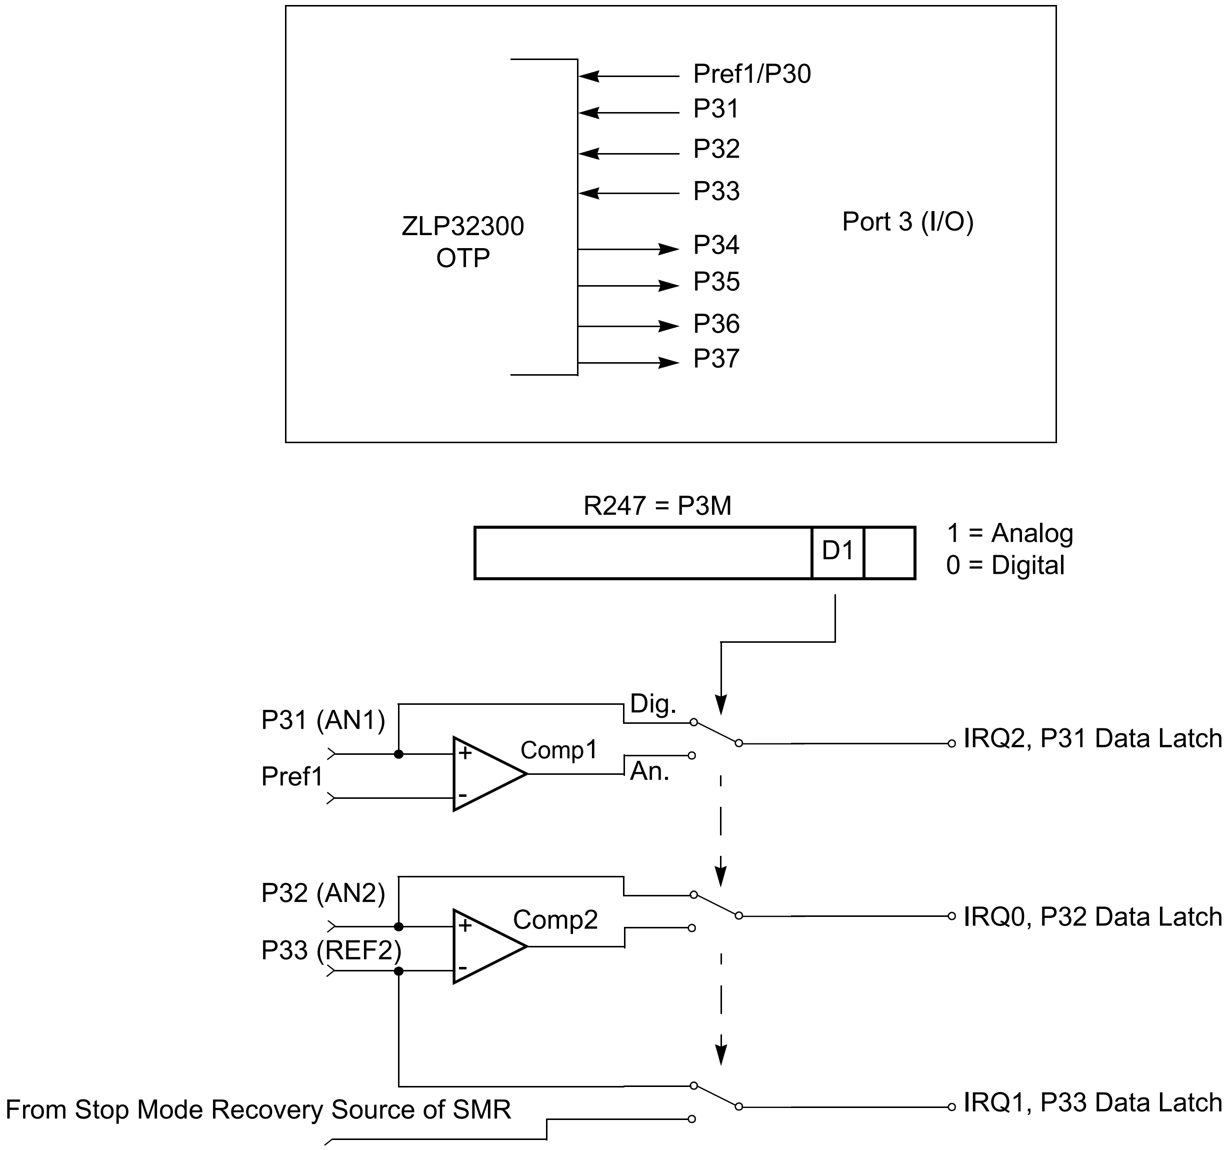

Figure 10. Port 3 Configuration

Two on-board comparators process analog signals on P31 and P32, with reference to the voltage on Pref1 and P33. The Analog function is enabled by programming the Port 3 Mode Register (bit 1). P31 and P32 are programmable as rising, falling, or both edge triggered interrupts (IRQ register bits 6 and 7). Pref1 and P33 are the comparator reference voltage inputs. Access to the Counter Timer edge-detection circuit is through P31 or P20

Functional Description

This device incorporates special functions to enhance the Z8 functionality in consumer and battery-operated applications.

Program Memory

This device addresses 32 KB of OTP memory. The first 12 bytes are reserved for interrupt vectors. These locations contain the six 16-bit vectors that correspond to the six available interrupts. See Figure 12.

RAM

This device features 256 B of RAM.

register RP select the working register group. Bits 3–0 of register RP select the expanded register file bank.

Note: *An expanded register bank is also referred to as an expanded register group (see Figure 13).*

T8 Enable

This field enables T8 when set (written) to 1.

Single/Modulo-N

When set to 0 (Modulo-N), the counter reloads the initial value when the terminal count is reached. When set to 1 (single-pass), the counter stops when the terminal count is reached.

Timeout

This bit is set when T8 times out (terminal count reached). To reset this bit, write a 1 to its location.

Caution: *Writing a 1 is the only way to reset the Terminal Count status condition. Reset this bit before using/enabling the counter/timers. The first clock of T8 might not have complete clock width and can occur any time when enabled.*

Note: *Ensure to manipulate CTR0, bit 5 and CTR1, bits 0 and 1 (DEMODULATION mode) when using the OR or AND commands. These instructions use a Read-Modify-Write sequence in which the current status from the CTR0 and CTR1 registers is ORed or ANDed with the designated value and then written back into the registers.*

T8 Clock

These bits define the frequency of the input signal to T8.

Capture_INT_Mask

Set this bit to allow an interrupt when data is captured into either LO8 or HI8 upon a positive or negative edge detection in DEMODULATION mode.

Counter_INT_Mask

Set this bit to allow an interrupt when T8 has a timeout.

P34_Out

This bit defines whether P34 is used as a normal output pin or the T8 output.

T8 and T16 Common Functions—CTR1(0D)01h

This register controls the functions in common with the T8 and T16.

Table 8 lists and briefly describes the fields for this register.

Table 8. CTR1(0D)01h T8 and T16 Common Functions

Field	Bit Position		Value	Description
Mode	7-------	R/W	0*	TRANSMIT Mode
			1	DEMODULATION Mode
P36_Out/	-6------	R/W		TRANSMIT Mode
Demodulator_Input			0*	Port Output
			1	T8/T16 Output
				DEMODULATION Mode
			0*	P31
			1	P20
T8/T16_Logic/	--54----	R/W		TRANSMIT Mode
Edge _Detect			00**	AND
			01	OR
			10	NOR
			11	NAND
				DEMODULATION Mode
			00**	Falling Edge
			01	Rising Edge
			10	Both Edges
			11	Reserved
Transmit_Submode/	----32--	R/W		TRANSMIT Mode
Glitch_Filter			00*	Normal Operation
			01	PING-PONG Mode
			10	T16_Out = 0
			11	T16_Out = 1
				DEMODULATION Mode
			00*	No Filter
			01	4 SCLK Cycle
			10	8 SCLK Cycle
			11	Reserved
Initial_T8_Out/	------1-			TRANSMIT Mode
Rising Edge		R/W	0*	T8_OUT is 0 Initially
			1	T8_OUT is 1 Initially
				DEMODULATION Mode
		R	0*	No Rising Edge
			1	Rising Edge Detected
		W	0	No Effect
			1	Reset Flag to 0

Initial_T8_Out/Rising_Edge

In TRANSMIT mode, if 0, the output of T8 is set to 0 when it starts to count. If 1, the output of T8 is set to 1 when it starts to count. When the counter is not enabled and this bit is set to 1 or 0, T8_OUT is set to the opposite state of this bit. This ensures that when the clock is enabled, a transition occurs to the initial state set by CTR1, D1.

In DEMODULATION mode, this bit is set to 1 when a rising edge is detected in the input signal. In order to reset the mode, a 1 should be written to this location.

Initial_T16 Out/Falling _Edge

In TRANSMIT mode, if it is 0, the output of T16 is set to 0 when it starts to count. If it is 1, the output of T16 is set to 1 when it starts to count. This bit is effective only in Normal or PING-PONG mode (CTR1, D3; D2). When the counter is not enabled and this bit is set, T16_OUT is set to the opposite state of this bit. This ensures that when the clock is enabled, a transition occurs to the initial state set by CTR1, D0.

In DEMODULATION mode, this bit is set to 1 when a falling edge is detected in the input signal. In order to reset it, a 1 should be written to this location.

Note: *Modifying CTR1 (D1 or D0) while the counters are enabled causes unpredictable output from T8/16_OUT.*

CTR2 Counter/Timer 16 Control Register—CTR2(D)02h

Table 9 lists and briefly describes the fields for this register.

Table 9. CTR2(D)02h: Counter/Timer16 Control Register

Field	Bit Position		Value	Description
T16_Enable	7 - - - - - - -	R	0*	Counter Disabled
			1	Counter Enabled
		W	0	Stop Counter
			1	Enable Counter
Single/Modulo-N	- 6 - - - - - -	R/W		TRANSMIT Mode
			0*	Modulo-N
			1	Single Pass
				DEMODULATION Mode
			0	T16 Recognizes Edge
			1	T16 Does Not Recognize Edge
Time_Out	- - 5 - - - - -	R	0*	No Counter Timeout
			1	Counter Timeout Occurred
		W	0	No Effect
			1	Reset Flag to 0

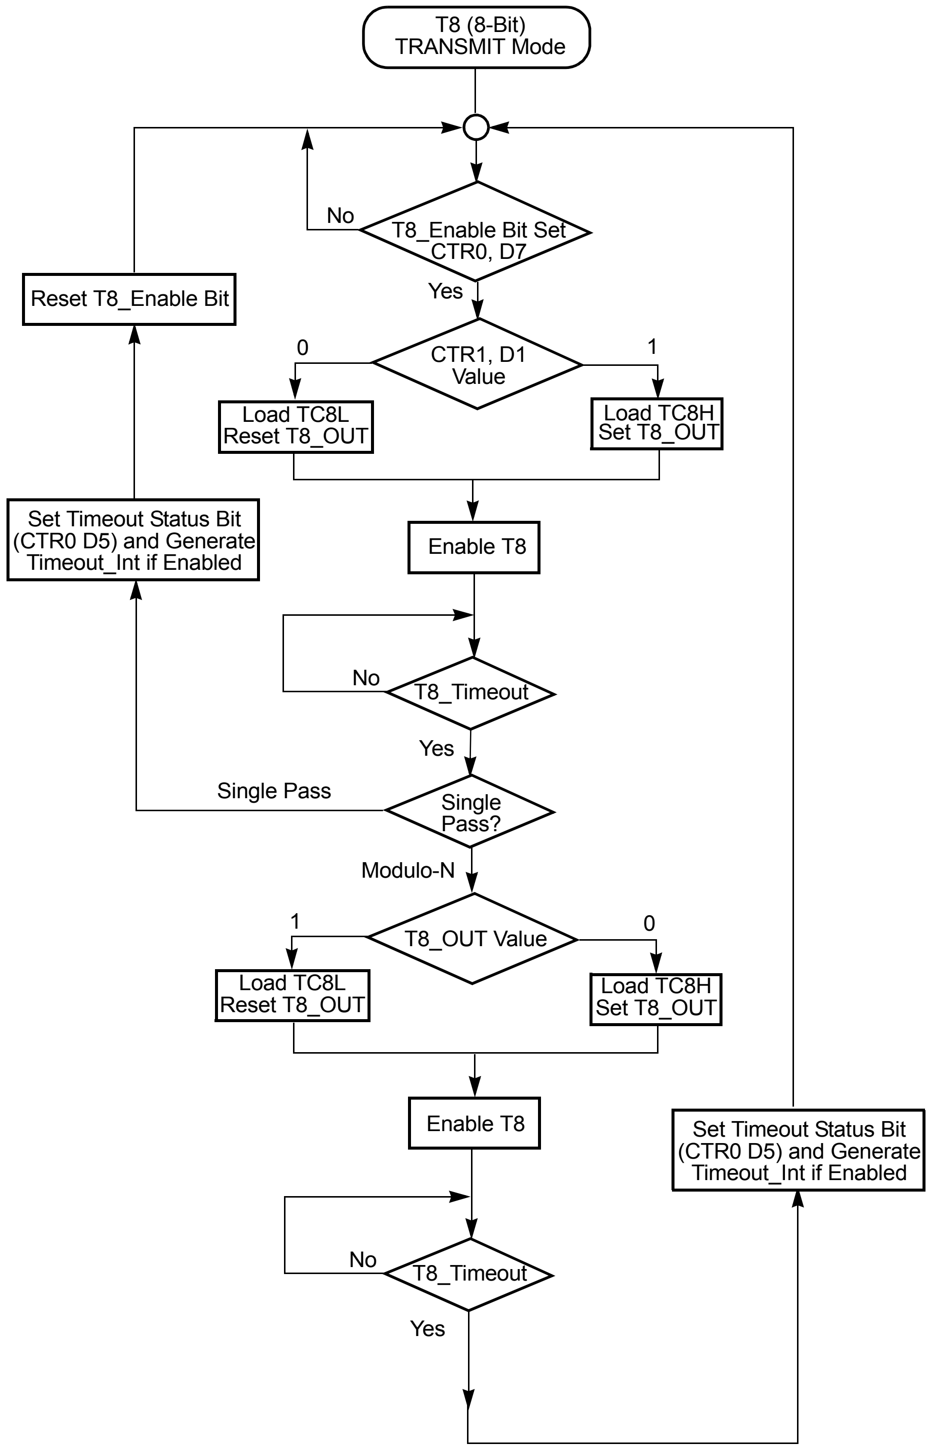

Figure 17. TRANSMIT Mode Flowchart

interrupt can be generated if enabled (CTR0, D1). T8 then continues counting from FFh (see Figure 21 and Figure 22).

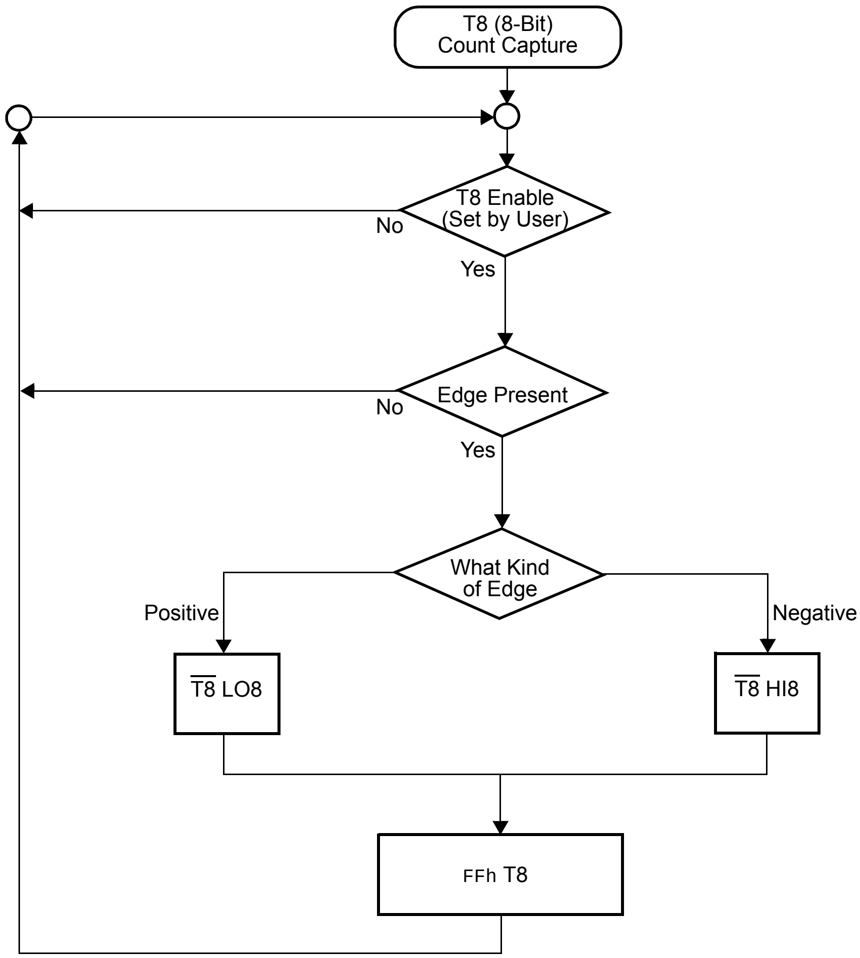

Figure 21. DEMODULATION Mode Count Capture Flowchart

Table 11. Interrupt Types, Sources, and Vectors

Name	Source	Vector Location	Comments
IRQ0	P32	0,1	External (P32), Rising, Falling Edge Triggered
IRQ1	P33	2,3	External (P33), Falling Edge Triggered
IRQ2	P31, T_{IN}	4,5	External (P31), Rising, Falling Edge Triggered
IRQ3	T16	6,7	Internal
IRQ4	T8	8,9	Internal
IRQ5	LVD	10,11	Internal

When more than one interrupt is pending, priorities are resolved by a programmable priority encoder controlled by the Interrupt Priority Register. An interrupt machine cycle activates when an interrupt request is granted. As a result, all subsequent interrupts are disabled, and the Program Counter and Status Flags are saved. The cycle then branches to the program memory vector location reserved for that interrupt. All Crimzon ZLP32300 interrupts are vectored through locations in the program memory. This memory location and the next byte contain the 16-bit address of the interrupt service routine for that particular interrupt request. To accommodate polled interrupt systems, interrupt inputs are masked, and the Interrupt Request register is polled to determine which of the interrupt requests require service.

An interrupt resulting from AN1 is mapped into IRQ2, and an interrupt from AN2 is mapped into IRQ0. Interrupts IRQ2 and IRQ0 can be rising, falling, or both edge triggered. These interrupts are programmable. The software can poll to identify the state of the pin.

Programming bits for the Interrupt Edge Select are located in the IRQ Register (R250), bits D7 and D6. The configuration is indicated in Table 12.

Table 12. IRQ Register

IRQ		Interrupt Edge	
D7	**D6**	**IRQ2 (P31)**	**IRQ0 (P32)**
0	0	F	F
0	1	F	R
1	0	R	F
1	1	R/F	R/F

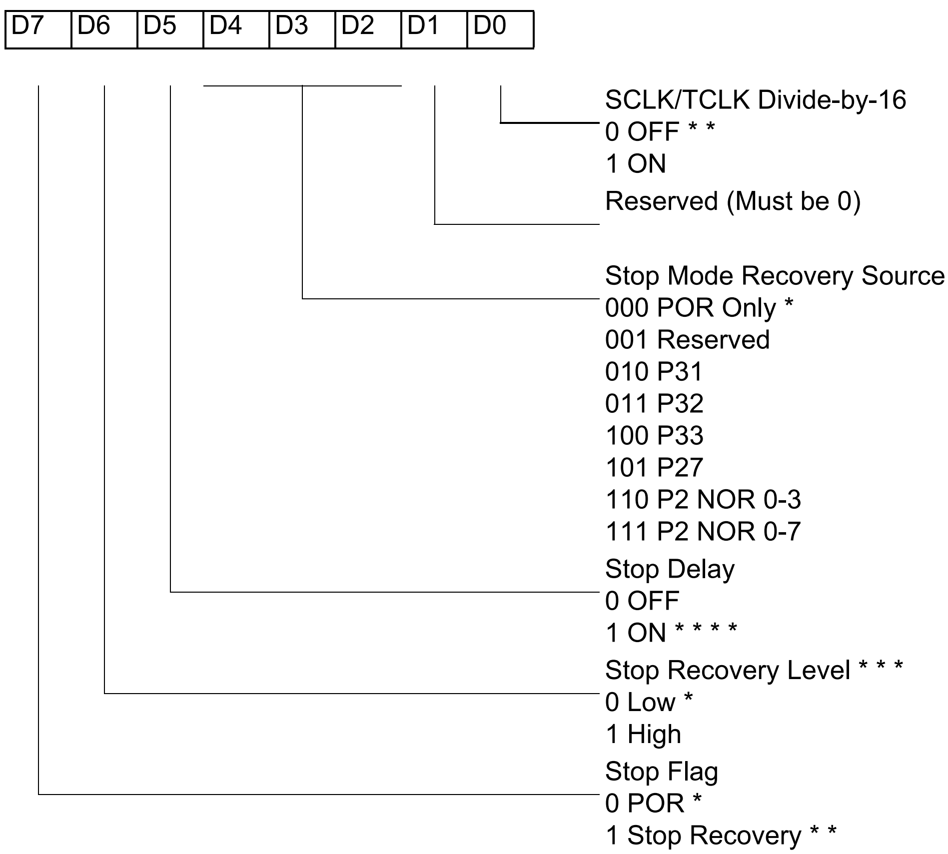
Note: F = Falling Edge; R = Rising Edge

Stop Mode Recovery

Stop Mode Recovery Register (SMR)

This register selects the clock divide value and determines the mode of Stop Mode Recovery (see Figure 31). All bits are write only except bit 7, which is read only. Bit 7 is a Flag bit that is hardware set on the condition of Stop recovery and reset by a power-on cycle. Bit 6 controls whether a low level or a high level at the XOR-gate input (see Figure 33 on page 52) is required from the recovery source. Bit 5 controls the reset delay after recovery. Bits D2, D3, and D4 of the SMR register specify the source of the Stop Mode Recovery signal. Bits D0 determines if SCLK/TCLK are divided by 16 or not. The SMR is located in Bank F of the Expanded Register Group at address `0Bh`.

SMR(0F)0Bh



*Default after Power-On Reset or Watchdog Reset
* *Default setting after Reset and Stop Mode Recovery.
* * *At the XOR gate input
* * * *Default setting after reset. Must be 1 if using a crystal or resonator clock source.

Figure 31. Stop Mode Recovery Register

Table 14. Stop Mode Recovery Source

SMR:432			Operation
D4	**D3**	**D2**	**Description of Action**
0	0	0	POR and/or external reset recovery
0	0	1	Reserved
0	1	0	P31 transition
0	1	1	P32 transition
1	0	0	P33 transition
1	0	1	P27 transition
1	1	0	Logical NOR of P20 through P23
1	1	1	Logical NOR of P20 through P27

Note: *Any Port 2 bit defined as an output drives the corresponding input to the default state. For example, if the NOR of P23-P20 is selected as the recovery source and P20 is configured as an output, the remaining SMR pins (P23-P21) form the NOR equation. This condition allows the remaining inputs to control the AND/OR function, refer to SMR2 register* on page 54 *for other recover sources.*

Stop Mode Recovery Delay Select (D5)

This bit, if low, disables the T_{POR} delay after Stop Mode Recovery. The default configuration of this bit is 1. If the 'fast' wake up is selected, the Stop Mode Recovery source must be kept active for at least 10 TpC.

Note: *This bit must be set to 1 if a crystal or resonator clock source is used. The T_{POR} delay allows the clock source to stabilize before executing instructions.*

Stop Mode Recovery Edge Select (D6)

A 1 in this bit position indicates that a High level on any one of the recovery sources wakes the Crimzon ZLP32300 from STOP mode. A 0 indicates Low level recovery. The default is 0 on POR.

Cold or Warm Start (D7)

This bit is read only. It is set to 1 when the device is recovered from STOP mode. The bit is set to 0 when the device reset is other than Stop Mode Recovery.

Table 16. EPROM Selectable Options

Port 00–03 Pull-Ups	ON/OFF
Port 04–07 Pull-Ups	ON/OFF
Port 10–13 Pull-Ups	ON/OFF
Port 14–17 Pull-Ups	ON/OFF
Port 20–27 Pull-Ups	ON/OFF
EPROM Protection	ON/OFF
Watchdog Timer at Power-On Reset	ON/OFF

Voltage Brownout/Standby

An on-chip Voltage Comparator checks that the V_{DD} is at the required level for correct operation of the device. Reset is globally driven when V_{DD} falls below V_{BO}. A small drop in V_{DD} causes the XTAL1 and XTAL2 circuitry to stop the crystal or resonator clock. If the V_{DD} is allowed to stay above V_{RAM}, the RAM content is preserved. When the power level is returned to above V_{BO}, the device performs a POR and functions normally.

Low-Voltage Detection

Low-Voltage Detection Register—LVD(D)0Ch

Note: *Voltage detection does not work at STOP mode.*

Field	Bit Position			Description
LVD	76543---			Reserved No Effect
	-----2--	R	1 0*	HVD Flag set HVD Flag reset
	------1-	R	1 0*	LVD Flag set LVD Flag reset
	-------0	R/W	1 0*	Enable VD Disable VD
*Default after POR				

Note: *Do not modify register P01M while checking a low-voltage condition. Switching noise of both Ports 0 and 1 together might trigger the LVD Flag.*

Expanded Register File Control Registers (0F)

The expanded register file control registers (0F) are displayed in Figure 42 through Figure 55 on page 74.
