#### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

## 2.3 Register Associated with DSP Instructions

### (1) Accumulator (ACC)

The accumulator (ACC) is a 64-bit register used for DSP instructions. The accumulator is also used for the multiply and multiply-and-accumulate instructions; EMUL, EMULU, FMUL, MUL, and RMPA, in which case the prior value in the accumulator is modified by execution of the instruction.

Use the MVTACHI and MVTACLO instructions for writing to the accumulator. The MVTACHI and MVTACLO instructions write data to the higher-order 32 bits (bits 63 to 32) and the lower-order 32 bits (bits 31 to 0), respectively.

Use the MVFACHI and MVFACMI instructions for reading data from the accumulator. The MVFACHI and MVFACMI instructions read data from the higher-order 32 bits (bits 63 to 32) and the middle 32 bits (bits 47 to 16), respectively.

- Longword-size I/O registers

```

MOV.L #SFR_ADDR, R1
MOV.L #SFR_DATA, [R1]
CMP [R1].L, R1
;; Next process

```

If multiple registers are written to and a subsequent instruction should be executed after the write operations are entirely completed, only read the I/O register that was last written to and execute the operation using the value; it is not necessary to read or execute operation for all the registers that were written to.

### (3) Number of Access Cycles to I/O Registers

For the number of I/O register access cycles, refer to Table 4.1, List of I/O Registers (Address Order). The number of access cycles to I/O registers is obtained by following equation.\*<sup>1</sup>

$$\begin{aligned} \text{Number of access cycles to I/O registers} = & \text{Number of bus cycles for internal main bus 1} + \\ & \text{Number of divided clock synchronization cycles} + \\ & \text{Number of bus cycles for internal peripheral busses 1 to 6} \end{aligned}$$

The number of bus cycles of internal peripheral bus 1 to 6 differs according to the register to be accessed.

When peripheral functions connected to internal peripheral bus 2 to 6 or registers for the external bus control unit (except for bus error related registers) are accessed, the number of divided clock synchronization cycles is added.

The number of divided clock synchronization cycles differs depending on the frequency ratio between ICLK and PCLK (or FCLK, BCLK) or bus access timing.

In the peripheral function unit, when the frequency ratio of ICLK is equal to or greater than that of PCLK (or FCLK), the sum of the number of bus cycles for internal main bus 1 and the number of the divided clock synchronization cycles will be one cycle of PCLK (or FCLK) at a maximum. Therefore, one PCLK (or FCLK) has been added to the number of access states shown in Table 4.1.

When the frequency ratio of ICLK is lower than that of PCLK (or FCLK), the subsequent bus access is started from the ICLK cycle following the completion of the access to the peripheral functions. Therefore, the access cycles are described on an ICLK basis.

In the external bus control unit, the sum of the number of bus cycles for internal main bus 1 and the number of divided clock synchronization cycles will be one cycle of BCLK at a maximum. Therefore, one BCLK is added to the number of access cycles shown in Table 4.1.

Note 1. This applies to the number of cycles when the access from the CPU does not conflict with the instruction fetching to the external memory or bus access from the different bus master (DMAC or DTC).

### (4) Restrictions in Relation to RMPA and String-Manipulation Instructions

The allocation of data to be handled by RMPA or string-manipulation instructions to I/O registers is prohibited, and operation is not guaranteed if this restriction is not observed.

## 5. Electrical Characteristics

### 5.1 Absolute Maximum Ratings

**Table 5.1 Absolute Maximum Ratings**

Conditions: VSS = AVSS0 = VREFL/VREFL0 = VSS\_USB = 0 V

Item	Symbol	Value	Unit	
Power supply voltage	VCC, VCC_USB	-0.3 to +4.6	V	
V <sub>BATT</sub> power supply voltage	V <sub>BATT</sub>	-0.3 to +4.6	V	
Input voltage (except for ports for 5 V tolerant <sup>*1</sup> )	V <sub>in</sub>	-0.3 to VCC + 0.3	V	
Input voltage (ports for 5 V tolerant <sup>*1</sup> )	V <sub>in</sub>	-0.3 to +5.8	V	
Reference power supply voltage	VREFH	-0.3 to VCC + 0.3	V	
Analog power supply voltage	AVCC <sup>*2</sup>	-0.3 to +4.6	V	
Analog input voltage	V <sub>AN</sub>	-0.3 to VCC + 0.3	V	
Operating temperature	D version	T <sub>opr</sub>	-40 to +85	°C
	G version		-40 to +105	°C
Storage temperature	T <sub>stg</sub>	-55 to +125	°C	

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

Note 1. Ports 07, 12 to 17, 20, 21, 30 to 33, 67, and C0 to C3 are 5 V tolerant.

Note 2. Connect AVCC0 to VCC. When neither the A/D converter nor the D/A converter is in use, do not leave the AVCC0, VREFH/VREFH0, AVSS0, and VREFL/VREFL0 pins open. Connect the AVCC0 and VREFH/VREFH0 pins to VCC, and the AVSS0 and VREFL/VREFL0 pins to VSS, respectively.

**Table 5.4 DC Characteristics (3) (for D and G Versions (-40 ≤ Ta ≤ +85°C))**

Conditions: VCC = AVCC0 = VREFH = VCC\_USB = V<sub>BATT</sub> = 2.7 to 3.6 V, VREFH0 = 2.7 V to AVCC0,  
VSS = AVSS0 = VREFL/VREFL0 = VSS\_USB = 0 V, T<sub>a</sub> = T<sub>opr</sub>

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
RAM standby voltage	V <sub>RAM</sub>	2.7	—	—	V	
VCC rising gradient	SrVCC	8.4	—	20000	μs/V	
VCC falling gradient*8	SfVCC	8.4	—	—	μs/V	

Note 1. Supply current values are with all output pins unloaded and all input pull-up MOSs in the off state.

Note 2. Measured with clocks supplied to the peripheral functions. This does not include the BGO operation.

Note 3. I<sub>CC</sub> depends on f (ICLK) as follows. (ICLK:PCLK:BCLK:BCLK pin = 8:4:4:2)

$$I_{CC} \text{ Max.} = 0.87 \times f + 13 \text{ (max. operation in high-speed operating mode)}$$

$$I_{CC} \text{ Typ.} = 0.35 \times f + 5 \text{ (normal operation in high-speed operating mode)}$$

$$I_{CC} \text{ Typ.} = 1.0 \times f + 3 \text{ (low-speed operating mode 1)}$$

$$I_{CC} \text{ Max.} = 0.53 \times f + 12 \text{ (sleep mode)}$$

Note 4. This does not include the BGO operation.

Note 5. This is the increase for programming or erasure of the ROM or flash memory for data storage during program execution.

Note 6. Supply of the clock signal to peripherals is stopped in this state. This does not include the BGO operation.

Note 7. The reference power supply current is included in the power supply current value for 10-bit A/D conversion and D/A conversion.

Note 8. When V<sub>BATT</sub> is used

Note 9. The current values for 10-bit A/D converter and 10-bit D/A converter are included in the current from the VREFH pin.

Note 10. The values are the sum of I<sub>AVCC0</sub> and I<sub>VREFH</sub>.
