Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

SRAM and FIFO

IGLOOe devices have embedded SRAM blocks along their north and south sides. Each variable-aspect-ratio SRAM block is 4,608 bits in size. Available memory configurations are 256×18, 512×9, 1k×4, 2k×2, and 4k×1 bits. The individual blocks have independent read and write ports that can be configured with different bit widths on each port. For example, data can be sent through a 4-bit port and read as a single bitstream. The embedded SRAM blocks can be initialized via the device JTAG port (ROM emulation mode) using the UJTAG macro.

In addition, every SRAM block has an embedded FIFO control unit. The control unit allows the SRAM block to be configured as a synchronous FIFO without using additional core VersaTiles. The FIFO width and depth are programmable. The FIFO also features programmable Almost Empty (AEMPTY) and Almost Full (AFULL) flags in addition to the normal Empty and Full flags. The embedded FIFO control unit contains the counters necessary for generation of the read and write address pointers. The embedded SRAM/FIFO blocks can be cascaded to create larger configurations.

PLL and CCC

IGLOOe devices provide designers with very flexible clock conditioning capabilities. Each member of the IGLOOe family contains six CCCs, each with an integrated PLL.

The six CCC blocks are located at the four corners and the centers of the east and west sides. One CCC (center west side) has a PLL.

The inputs of the six CCC blocks are accessible from the FPGA core or from one of several inputs located near the CCC that have dedicated connections to the CCC block.

The CCC block has these key features:

- Wide input frequency range (f_{IN_CCC}) = 1.5 MHz up to 250 MHz
- Output frequency range (f_{OUT_CCC}) = 0.75 MHz up to 250 MHz
- 2 programmable delay types for clock skew minimization
- Clock frequency synthesis

Additional CCC specifications:

- Internal phase shift = 0°, 90°, 180°, and 270°. Output phase shift depends on the output divider configuration.
- Output duty cycle = 50% ± 1.5% or better
- Low output jitter: worst case < 2.5% × clock period peak-to-peak period jitter when single global network used
- Maximum acquisition time is 300 µs
- Exceptional tolerance to input period jitter—allowable input jitter is up to 1.5 ns
- Four precise phases; maximum misalignment between adjacent phases of 40 ps × 250 MHz / f_{OUT_CCC}

Global Clocking

IGLOOe devices have extensive support for multiple clocking domains. In addition to the CCC and PLL support described above, there is a comprehensive global clock distribution network.

Each VersaTile input and output port has access to nine VersaNets: six chip (main) and three quadrant global networks. The VersaNets can be driven by the CCC or directly accessed from the core via multiplexers (MUXes). The VersaNets can be used to distribute low-skew clock signals or for rapid distribution of high-fanout nets.

Calculating Power Dissipation

Quiescent Supply Current

Quiescent supply current (IDD) calculation depends on multiple factors, including operating voltages (VCC, VCCI, and VJTAG), operating temperature, system clock frequency, and power modes usage. Microsemi recommends using the PowerCalculator and SmartPower software estimation tools to evaluate the projected static and active power based on the user design, power mode usage, operating voltage, and temperature.

Notes:

1. *Maximum value obtained for a Std. speed grade device in Worst Case Commercial Conditions. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-6 for derating values.*
2. *This delay is a function of voltage and temperature. See Table 2-6 on page 2-6 and Table 2-7 on page 2-6 for deratings.*
3. *T_J = 25°C, VCC = 1.5 V*
4. *When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the Libero SoC Online Help associated with the core for more information.*
5. *VCO output jitter is calculated as a percentage of the VCO frequency. The jitter (in ps) can be calculated by multiplying the VCO period by the per cent jitter. The VCO jitter (in ps) applies to CCC_OUT regardless of the output divider settings. For example, if the jitter on VCO is 300 ps, the jitter on CCC_OUT is also 300 ps, regardless of the output divider settings.*
6. *Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by period jitter parameter.*
7. *For definitions of Type 1 and Type 2, refer to the PLL Block Diagram in the "Clock Conditioning Circuits in IGLOO and ProASIC3 Devices" chapter of the IGLOOe FPGA Fabric User's Guide.*

Revision	Changes	Page
Revision 8 (Nov 2009)	The version changed to v2.0 for IGLOOe datasheet chapters, indicating the datasheet contains information based on final characterization.	N/A
Product Brief v2.0	The "Pro (Professional) I/O" section was revised to add "Hot-swappable and cold-sparing I/Os."	I
	The "Reprogrammable Flash Technology" section was revised to add "250 MHz (1.5 V systems) and 160 MHz (1.2 V systems) System Performance."	I
	Definitions of hot-swap and cold-sparing were added to the "Pro I/Os with Advanced I/O Standards" section.	1-7
DC and Switching Characteristics v2.0	3.3 V LVCMOS and 1.2 V LVCMOS Wide Range support was added to the datasheet. This affects all tables that contained 3.3 V LVCMOS and 1.2 V LVCMOS data.	N/A
	IIL and IIH input leakage current information was added to all "Minimum and Maximum DC Input and Output Levels" tables.	N/A
	Values for 1.2 V wide range DC core supply voltage were added to Table 2-2 • Recommended Operating Conditions 1. Table notes regarding 3.3 V wide range and the core voltage required for programming were added to the table.	2-2
	The data in Table 2-6 • Temperature and Voltage Derating Factors for Timing Delays (1.5 V DC core supply voltage) and Table 2-7 • Temperature and Voltage Derating Factors for Timing Delays (1.2 V DC core supply voltage) was revised.	2-6
	3.3 V LVCMOS wide range data was included in Table 2-13 • Summary of I/O Input Buffer Power (per pin) – Default I/O Software Settings and Table 2-14 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings1. Table notes were added in connection with this data.	2-9, 2-10
	The temperature was revised from 110ºC to 100ºC in Table 2-31 • Duration of Short Circuit Event before Failure and Table 2-33 • I/O Input Rise Time, Fall Time, and Related I/O Reliability*.	2-31, 2-31
	The tables in the "Overview of I/O Performance" section and "Detailed I/O DC Characteristics" sectionwere revised to include 3.3 V LVCMOS and 1.2 V LVCMOS wide range.	2-20, 2-28
	Most tables were updated in the following sections, revising existing values and adding information for 3.3 V and 1.2 V wide range: "Single-Ended I/O Characteristics" "Voltage-Referenced I/O Characteristics" "Differential I/O Characteristics"	2-32, 2-51, 2-62
	The value for "Delay range in block: fixed delay" was revised in Table 2-143 • IGLOOe CCC/PLL Specification and Table 2-144 • IGLOOe CCC/PLL Specification.	2-91, 2-92
	The timing characteristics tables for RAM4K9 and RAM512X18 were updated, including renaming of the address collision parameters.	2-98 – 2-101
Revision 7 (Apr 2009) Product Brief v1.4 DC and Switching Characteristics Advance v0.4	The –F speed grade is no longer offered for IGLOOe devices and was removed from the documentation. The speed grade column and note regarding –F speed grade were removed from "IGLOOe Ordering Information". The "Speed Grade and Temperature Grade Matrix" section was removed.	III, IV
