Microchip Technology - DSPIC33FJ32GS608-E/PT Datasheet

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	40 MIPs
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, QEI, POR, PWM, WDT
Number of I/O	74
Program Memory Size	32KB (32K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	4K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 18x10b; D/A 1x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	80-TQFP
Supplier Device Package	80-TQFP (12x12)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic33fj32gs608-e-pt

4.6.3 READING DATA FROM PROGRAM MEMORY USING PROGRAM SPACE VISIBILITY

The upper 32 Kbytes of data space may optionally be mapped into any 16K word page of the program space. This option provides transparent access to stored constant data from the data space without the need to use special instructions (such as TBLRDL/H).

Program space access through the data space occurs if the Most Significant bit of the data space EA is '1' and program space visibility is enabled by setting the PSV bit in the Core Control register (CORCON<2>). The location of the program memory space to be mapped into the data space is determined by the Program Space Visibility Page register (PSVPAG). This 8-bit register defines any one of 256 possible pages of 16K words in program space. In effect, PSVPAG functions as the upper 8 bits of the program memory address, with the 15 bits of the EA functioning as the lower bits. By incrementing the PC by 2 for each program memory word, the lower 15 bits of data space addresses directly map to the lower 15 bits in the corresponding program space addresses.

Data reads to this area add a cycle to the instruction being executed, since two program memory fetches are required.

Although each data space address 8000h and higher maps directly into a corresponding program memory address (see Figure 4-11), only the lower 16 bits of the 24-bit program word are used to contain the data. The upper 8 bits of any program space location used as data should be programmed with '1111 1111' or '0000 0000' to force a NOP. This prevents possible issues should the area of code ever be accidentally executed.

Note:	PSV access is temporarily disabled during Table Reads/Writes.

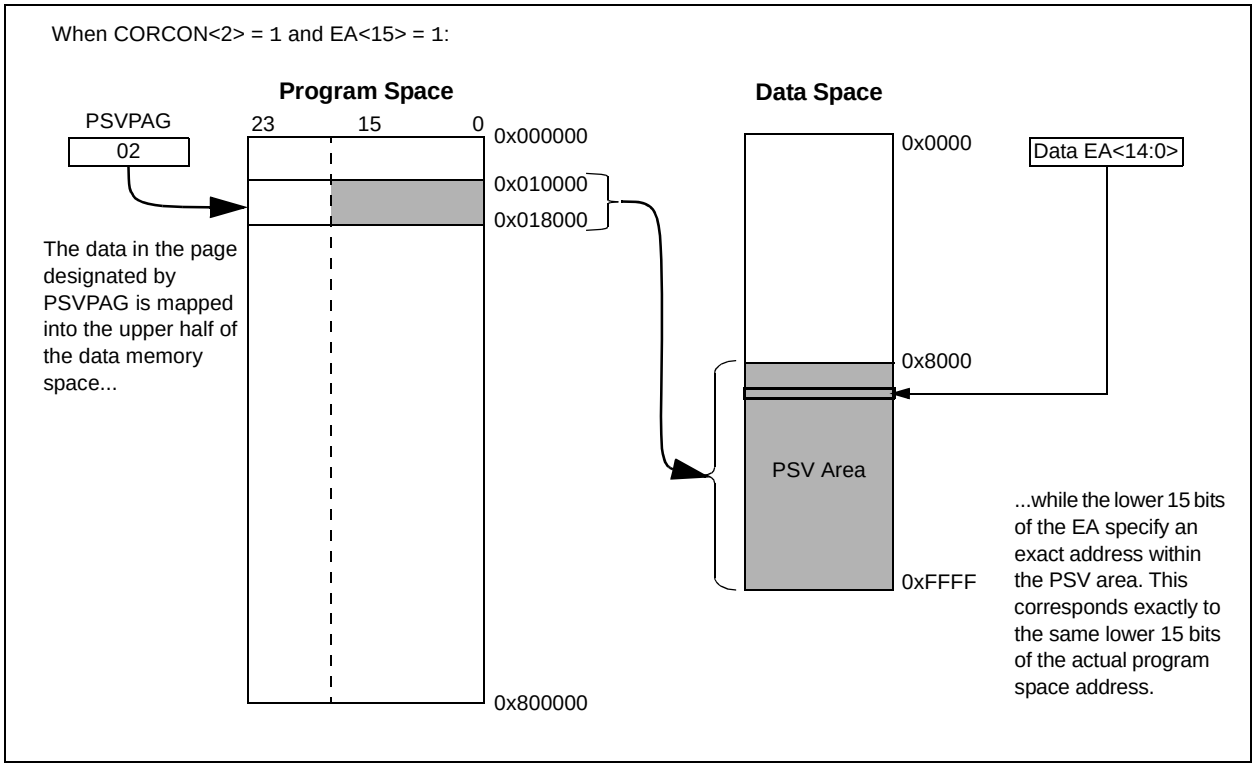
For operations that use PSV and are executed outside a REPEAT loop, the MOV and MOV.D instructions require one instruction cycle in addition to the specified execution time. All other instructions require two instruction cycles in addition to the specified execution time.

For operations that use PSV and are executed inside a REPEAT loop, these instances require two instruction cycles in addition to the specified execution time of the instruction:

- Execution in the first iteration
- Execution in the last iteration
- Execution prior to exiting the loop due to an interrupt
- Execution upon re-entering the loop after an interrupt is serviced

Any other iteration of the REPEAT loop will allow the instruction using PSV to access data, to execute in a single cycle.

FIGURE 4-11: PROGRAM SPACE VISIBILITY OPERATION



NOTES:

6.1 System Reset

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices have two types of Reset:

- Cold Reset
- Warm Reset

A Cold Reset is the result of a Power-on Reset (POR) or a Brown-out Reset (BOR). On a Cold Reset, the FNOSCx Configuration bits in the FOSC Configuration register select the device clock source.

A Warm Reset is the result of all the other Reset sources, including the RESET instruction. On Warm Reset, the device will continue to operate from the current clock source as indicated by the Current Oscillator Selection (COSC<2:0>) bits in the Oscillator Control (OSCCON<14:12>) register.

The device is kept in a Reset state until the system power supplies have stabilized at appropriate levels and the oscillator clock is ready. The sequence in which this occurs is described in Figure 6-2.

TABLE 6-1: OSCILLATOR DELAY

Oscillator Mode	Oscillator Start-up Delay	Oscillator Start-up Timer	PLL Lock Time	Total Delay
FRC, FRCDIV16, FRCDIVN	T_{OSCD}(1)	—	—	T_{OSCD}(1)
FRCPLL	T_{OSCD}(1)	—	T_{LOCK}(3)	T_{OSCD} + T_{LOCK}(1,3)
XT	T_{OSCD}(1)	T_{OST}(2)	—	T_{OSCD} + T_{OST}(1,2)
HS	T_{OSCD}(1)	T_{OST}(2)	—	T_{OSCD} + T_{OST}(1,2)
EC	—	—	—	—
XTPLL	T_{OSCD}(1)	T_{OST}(2)	T_{LOCK}(3)	T_{OSCD} + T_{OST} + T_{LOCK}(1,2,3)
HSPLL	T_{OSCD}(1)	T_{OST}(2)	T_{LOCK}(3)	T_{OSCD} + T_{OST} + T_{LOCK}(1,2,3)
ECPLL	—	—	T_{LOCK}(3)	T_{LOCK}(3)
LPRC	T_{OSCD}(1)	—	—	T_{OSCD}(1)

Note 1: T_{OSCD} = Oscillator start-up delay (1.1 μs max. for FRC, 70 μs max. for LPRC). Crystal oscillator start-up times vary with the crystal characteristics, load capacitance, etc.

2: T_{OST} = Oscillator Start-up Timer (OST) delay (1024 oscillator clock period). For example, T_{OST} = 102.4 μs for a 10 MHz crystal and T_{OST} = 32 ms for a 32 kHz crystal.

3: T_{LOCK} = PLL lock time (1.5 ms nominal) if PLL is enabled.

1 = A bus error occurred while the message was being sent
0 = A bus error did not occur while the message was being sent

bit 3 **TXREQm:** Message Send request bit
1 = Requests that a message be sent; the bit automatically clears when the message is successfully sent
0 = Clears the bit to '0'; while set, requests a message abort

bit 2 **RTRENm:** Auto-Remote Transmit Enable bit
1 = When a remote transmit is received, TXREQm will be set
0 = When a remote transmit is received, TXREQm will be unaffected

bit 1-0 **TXmPRI<1:0>:** Message Transmission Priority bits
11 = Highest message priority
10 = High intermediate message priority
01 = Low intermediate message priority
00 = Lowest message priority

Note 1: This bit is cleared when TXREQm is set.

Note: The buffers, SID, EID, DLC, Data Field, and Receive Status registers are located in DMA RAM.

22.0 HIGH-SPEED, 10-BIT ANALOG-TO-DIGITAL CONVERTER (ADC)

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"High-Speed 10-Bit ADC"** (DS70000321) in the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com). The information in this data sheet supersedes the information in the FRM.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices provide high-speed successive approximation Analog-to-Digital conversions to support applications, such as AC/DC and DC/DC power converters.

22.1 Features Overview

The ADC module incorporates the following features:

- 10-Bit Resolution
- Unipolar Inputs
- Up to Two Successive Approximation Registers (SARs)
- Up to 24 External Input Channels
- Two Internal Analog Inputs
- Dedicated Result Register for each Analog Input
- ±1 LSB Accuracy at 3.3V
- Single Supply Operation
- 4 Msps Conversion Rate at 3.3V (devices with two SARs)
- 2 Msps Conversion Rate at 3.3V (devices with one SAR)
- Low-Power CMOS Technology

22.2 Module Description

This ADC module is designed for applications that require low latency between the request for conversion and the resultant output data. Typical applications include:

- AC/DC Power Supplies
- DC/DC Converters
- Power Factor Correction (PFC)

This ADC works with the High-Speed PWM module in power control applications that require high-frequency control loops. This module can Sample-and-Convert two analog inputs in a 0.5 microsecond when two SARs are used. This small conversion delay reduces the "phase lag" between measurement and control system response.

Up to five inputs may be sampled at a time (four inputs from the dedicated Sample-and-Hold circuits and one from the shared Sample-and-Hold circuit). If multiple inputs request conversion, the ADC will convert them in a sequential manner, starting with the lowest order input.

This ADC design provides each pair of analog inputs (AN1, AN0), (AN3, AN2),..., the ability to specify its own trigger source out of a maximum of sixteen different trigger sources. This capability allows this ADC to Sample-and-Convert analog inputs that are associated with PWM generators operating on independent time bases.

The user application typically requires synchronization between analog data sampling and PWM output to the application circuit. The very high-speed operation of this ADC module allows "data on demand".

In addition, several hardware features have been added to the peripheral interface to improve real-time performance in a typical DSP-based application.

- Result Alignment Options
- Automated Sampling
- External Conversion Start Control
- Two Internal Inputs to Monitor the INTREF and EXTREF Input Signals

Block diagrams of the ADC module for the family devices are shown in Figure 22-1 through Figure 22-4.

22.3 Module Functionality

The High-Speed, 10-Bit ADC is designed to support power conversion applications when used with the High-Speed PWM module. The ADC may have one or two SAR modules, depending on the device variant. If two SARs are present on a device, two conversions can be processed at a time, yielding 4 Msps conversion rate. If only one SAR is present on a device, only one conversion can be processed at a time, yielding 2 Msps conversion rate. The High-Speed, 10-Bit ADC produces two 10-bit conversion results in a 0.5 microsecond.

The ADC module supports up to 24 external analog inputs and two internal analog inputs. To monitor reference voltage, two internal inputs, AN24 and AN25, are connected to EXTREF and INTREF, respectively.

The analog reference voltage is defined as the device supply voltage (AV_{DD}/AV_{SS}).

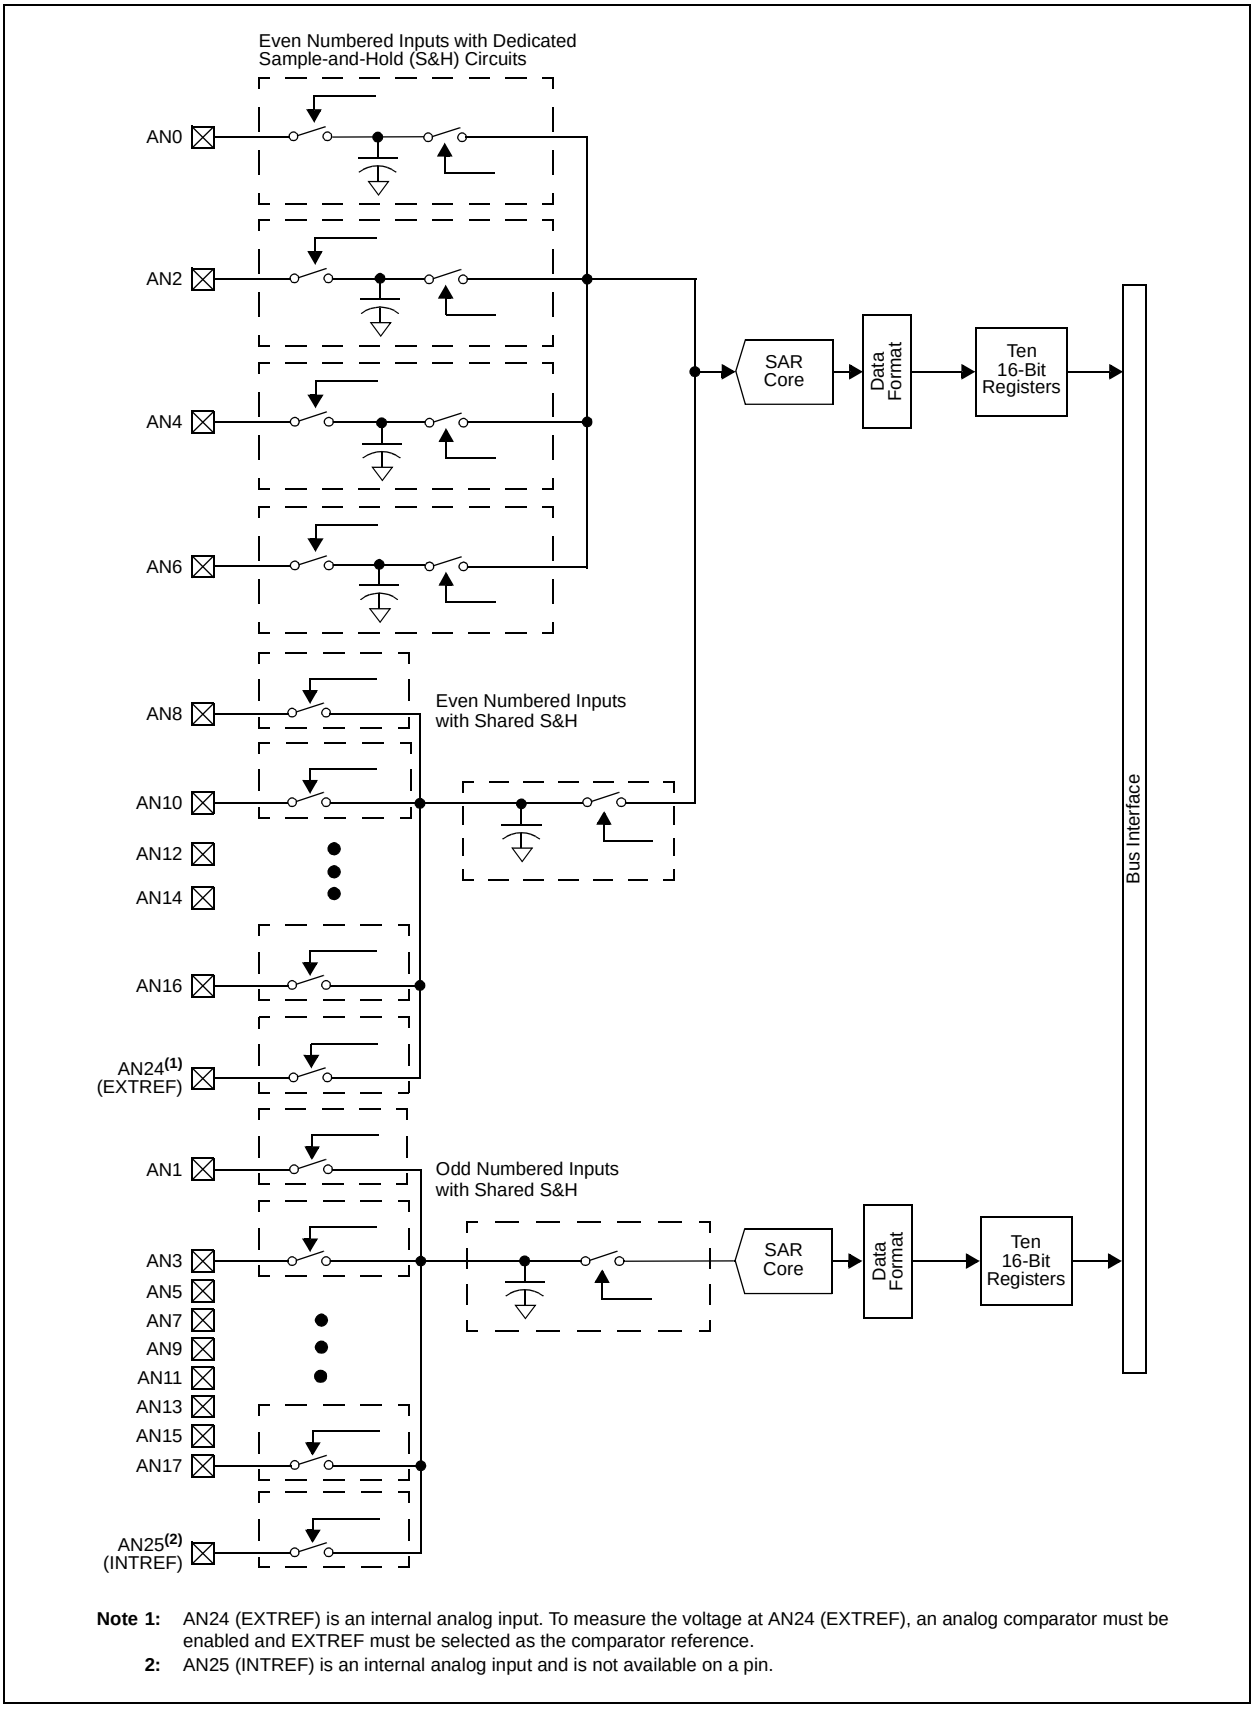
The ADC module uses the following control and status registers:

- ADCON: ADC Control Register
- ADSTAT: ADC Status Register
- ADBASE: ADC Base Register(1,2)
- ADPCFG: ADC Port Configuration Register
- ADPCFG2: ADC Port Configuration Register 2
- ADCPC0: ADC Convert Pair Control Register 0
- ADCPC1: ADC Convert Pair Control Register 1
- ADCPC2: ADC Convert Pair Control Register 2
- ADCPC3: ADC Convert Pair Control Register 3
- ADCPC4: ADC Convert Pair Control Register 4
- ADCPC5: ADC Convert Pair Control Register 5
- ADCPC6: ADC Convert Pair Control Register 6(2)

The ADCON register controls the operation of the ADC module. The ADSTAT register displays the status of the conversion processes. The ADPCFG registers configure the port pins as analog inputs or as digital I/O. The ADCPCx registers control the triggering of the ADC conversions. See Register 22-1 through Register 22-12 for detailed bit configurations.

Note:	A unique feature of the ADC module is its ability to sample inputs in an asynchronous manner. Individual Sample-and-Hold circuits can be triggered independently of each other.

FIGURE 22-3: ADC BLOCK DIAGRAM FOR dsPIC33FJ32GS608 AND dsPIC33FJ64GS608 DEVICES WITH TWO SARs



Note 1: AN24 (EXTREF) is an internal analog input. To measure the voltage at AN24 (EXTREF), an analog comparator must be enabled and EXTREF must be selected as the comparator reference.

2: AN25 (INTREF) is an internal analog input and is not available on a pin.

REGISTER 22-10: ADCPC4: ADC CONVERT PAIR CONTROL REGISTER 4

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
IRQEN9	PEND9	SWTRG9	TRGSRC94	TRGSRC93	TRGSRC92	TRGSRC91	TRGSRC90
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
IRQEN8	PEND8	SWTRG8	TRGSRC84	TRGSRC83	TRGSRC82	TRGSRC81	TRGSRC80
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **IRQEN9:** Interrupt Request Enable 9 bit
1 = Enable IRQ generation when requested conversion of channels AN19 and AN18 is completed
0 = IRQ is not generated

bit 14 **PEND9:** Pending Conversion Status 9 bit
1 = Conversion of channels AN19 and AN18 is pending; set when selected trigger is asserted
0 = Conversion is complete

bit 13 **SWTRG9:** Software Trigger 9 bit
1 = Starts conversion of AN19 and AN18 (if selected by the TRGSRCx<4:0> bits)**(1)**
This bit is automatically cleared by hardware when the PEND9 bit is set.
0 = Conversion is not started

Note 1: The trigger source must be set as an individual software trigger prior to setting this bit to '1'. If other conversions are in progress, the conversion is performed when the conversion resources are available.

TABLE 25-2: INSTRUCTION SET OVERVIEW

Base Instr #	Assembly Mnemonic	Assembly Syntax		Description	# of Words	# of Cycles	Status Flags Affected
1	ADD	ADD	Acc	Add Accumulators	1	1	OA,OB,SA,SB
		ADD	f	f = f + WREG	1	1	C,DC,N,OV,Z
