Microchip Technology - DSPIC33FJ32GS608T-50I/PT Datasheet

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	50 MIPs
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, QEI, POR, PWM, WDT
Number of I/O	74
Program Memory Size	32KB (32K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	4K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 18x10b; D/A 1x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	80-TQFP
Supplier Device Package	80-TQFP (12x12)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic33fj32gs608t-50i-pt

TABLE 4-66: FUNDAMENTAL ADDRESSING MODES SUPPORTED

Addressing Mode	Description
File Register Direct	The address of the file register is specified explicitly.
Register Direct	The contents of a register are accessed directly.
Register Indirect	The contents of Wn forms the Effective Address (EA).
Register Indirect Post-Modified	The contents of Wn forms the EA. Wn is post-modified (incremented or decremented) by a constant value.
Register Indirect Pre-Modified	Wn is pre-modified (incremented or decremented) by a signed constant value to form the EA.
Register Indirect with Register Offset (Register Indexed)	The sum of Wn and Wb forms the EA.
Register Indirect with Literal Offset	The sum of Wn and a literal forms the EA.

4.3.3 MOVE AND ACCUMULATOR INSTRUCTIONS

Move instructions and the DSP accumulator class of instructions provide a greater degree of addressing flexibility than other instructions. In addition to the addressing modes supported by most MCU instructions, move and accumulator instructions also support Register Indirect with Register Offset Addressing mode, also referred to as Register Indexed mode.

Note: For the MOV instructions, the addressing mode specified in the instruction can differ for the source and destination EA. However, the 4-bit Wb (Register Offset) field is shared by both source and destination (but typically only used by one).

In summary, the following addressing modes are supported by move and accumulator instructions:

- Register Direct
- Register Indirect
- Register Indirect Post-Modified
- Register Indirect Pre-Modified
- Register Indirect with Register Offset (Indexed)
- Register Indirect with Literal Offset
- 8-Bit Literal
- 16-Bit Literal

Note: Not all instructions support all the addressing modes given above. Individual instructions may support different subsets of these addressing modes.

4.3.4 MAC INSTRUCTIONS

The dual source operand DSP instructions (CLR, ED, EDAC, MAC, MPY, MPY.N, MOVSAC and MSC), also referred to as MAC instructions, use a simplified set of addressing modes to allow the user application to effectively manipulate the Data Pointers through Register Indirect tables.

The two-source operand, prefetch registers must be members of the set: {W8, W9, W10, W11}. For data reads, W8 and W9 are always directed to the X RAGU, and W10 and W11 are always directed to the Y AGU. The Effective Addresses generated (before and after modification) must, therefore, be valid addresses within X data space for W8 and W9 and Y data space for W10 and W11.

Note: Register Indirect with Register Offset Addressing mode is available only for W9 (in X space) and W11 (in Y space).

In summary, the following addressing modes are supported by the MAC class of instructions:

- Register Indirect
- Register Indirect Post-Modified by 2
- Register Indirect Post-Modified by 4
- Register Indirect Post-Modified by 6
- Register Indirect with Register Offset (Indexed)

4.3.5 OTHER INSTRUCTIONS

Besides the addressing modes outlined previously, some instructions use literal constants of various sizes. For example, BRA (branch) instructions use 16-bit signed literals to specify the branch destination directly, whereas the DISI instruction uses a 14-bit unsigned literal field. In some instructions, such as ADD Acc, the source of an operand or result is implied by the opcode itself. Certain operations, such as NOP, do not have any operands.

The DMA Controller features four identical data transfer channels. Each channel has its own set of control and status registers. Each DMA channel can be configured to copy data either from buffers stored in dual port DMA RAM to peripheral SFRs or from peripheral SFRs to buffers in DMA RAM.

The DMA Controller supports the following features:

- Word or byte-sized data transfers.
- Transfers from peripheral to DMA RAM or DMA RAM to peripheral
- Indirect Addressing of DMA RAM locations with or without automatic post-increment
- Peripheral Indirect Addressing – In some peripherals, the DMA RAM read/write addresses may be partially derived from the peripheral
- One-Shot Block Transfers – Terminating a DMA transfer after one block transfer
- Continuous Block Transfers – Reloading the DMA RAM buffer start address after every block transfer is complete
- Ping-Pong Mode – Switching between two DMA RAM start addresses between successive block transfers, thereby filling two buffers alternately
- Automatic or manual initiation of block transfers

For each DMA channel, a DMA interrupt request is generated when a block transfer is complete. Alternatively, an interrupt can be generated when half of the block has been filled.

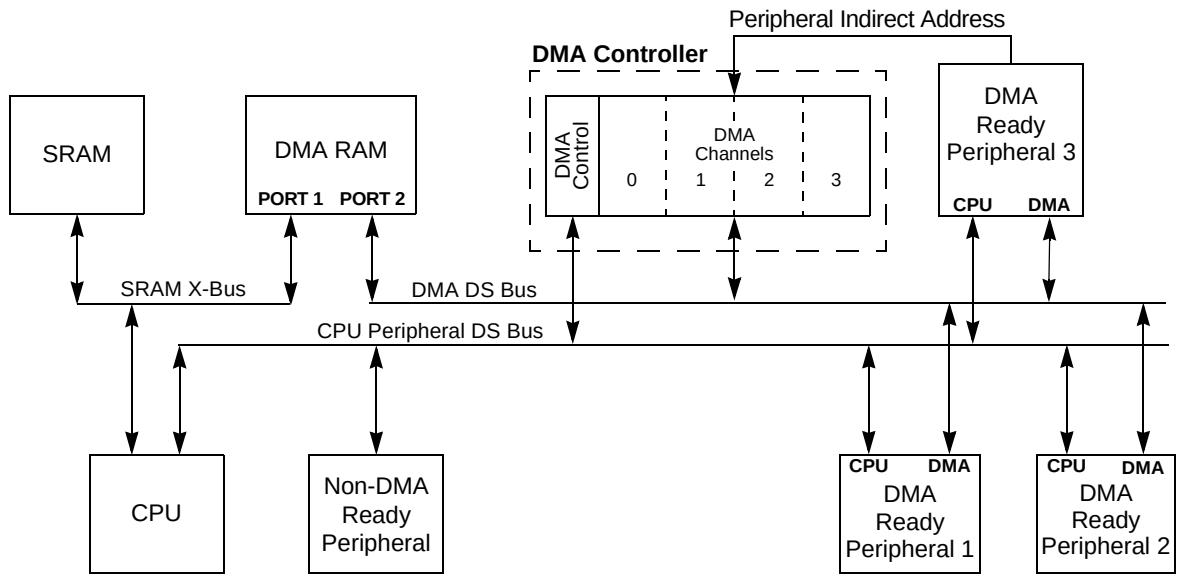
8.1 DMAC Registers

Each DMAC Channel x (x = 0, 1, 2 or 3) contains the following registers:

- A 16-Bit DMA Channel Control Register (DMAxCON)
- A 16-Bit DMA Channel IRQ Select Register (DMAxREQ)
- A 16-Bit DMA RAM Primary Start Address Offset Register (DMAxSTA)
- A 16-Bit DMA RAM Secondary Start Address Offset Register (DMAxSTB)
- A 16-Bit DMA Peripheral Address Register (DMAxPAD)
- A 10-Bit DMA Transfer Count Register (DMAxCNT)

An additional pair of status registers, DMACS0 and DMACS1, are common to all DMAC channels.

FIGURE 8-1: TOP LEVEL SYSTEM ARCHITECTURE USING A DEDICATED TRANSACTION BUS



Note: For clarity, CPU and DMA address buses are not shown.

NOTES:

16.3 Control Registers

The following registers control the operation of the high-speed PWM module.

- PTCON: PWM Time Base Control Register
- PTCON2: PWM Clock Divider Select Register 2
- PTPER: PWM Primary Master Time Base Period Register(1,2)
- SEVTCMP: PWM Special Event Compare Register(1)
- STCON: PWM Secondary Master Time Base Control Register
- STCON2: PWM Secondary Clock Divider Select Register 2
- STPER: PWM Secondary Master Time Base Period Register
- SSEVTCMP: PWM Secondary Special Event Compare Register
- CHOP: PWM Chop Clock Generator Register(1)
- MDC: PWM Master Duty Cycle Register(1,2)
- PWMCONx: PWM Control x Register
- PDCx: PWM Generator Duty Cycle x Register(1,2,3)
- PHASEx: PWM Primary Phase-Shift x Register(1,2)
- DTRx: PWM Dead-Time x Register
- ALTDTRx: PWM Alternate Dead-Time x Register
- SDCx: PWM Secondary Duty Cycle x Register(1,2,3)
- SPHASEx: PWM Secondary Phase-Shift x Register(1,2)
- TRGCONx: PWM Trigger Control x Register
- IOCONx: PWM I/O Control x Register
- FCLCONx: PWM Fault Current-Limit Control x Register
- TRIGx: PWM Primary Trigger x Compare Value Register
- STRIGx: PWM Secondary Trigger x Compare Value Register(1)
- LEBCONx: Leading-Edge Blanking Control x Register
- LEBDLYx: Leading-Edge Blanking Delay x Register
- AUXCONx: PWM Auxiliary Control x Register
- PWMCAPx: Primary PWM Time Base Capture x Register

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-3 **PWMCAP<12:0>:** Captured PWM Time Base Value bits(1,2,3,4)
The value in this register represents the captured PWM time base value when a leading edge is detected on the current-limit input.

bit 2-0 **Unimplemented:** Read as '0'

Note 1: The capture feature is only available on the primary output (PWMxH).
2: This feature is active only after LEB processing on the current-limit input signal is complete.
3: The minimum capture resolution is 8.32 ns.
4: This feature can be used when the XPRES bit (PWMCONx<1>) is set to '0'.

19.0 INTER-INTEGRATED CIRCUIT (I²C™)

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Inter-Integrated Circuit™ (I²C™)"** (DS70000195) in the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com). The information in this data sheet supersedes the information in the FRM.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The Inter-Integrated Circuit (I²C) module provides complete hardware support for both Slave and Multi-Master modes of the I²C serial communication standard with a 16-bit interface.

The I²C module has a 2-pin interface:

- The SCLx pin is clock.
- The SDAx pin is data.

The I²C module offers the following key features:

- I²C Interface Supporting Both Master and Slave modes of Operation
- I²C Slave mode Supports 7-Bit and 10-Bit Addressing
- I²C Master mode Supports 7-Bit and 10-Bit Addressing
- I²C Port allows Bidirectional Transfers Between Master and Slaves
- Serial Clock Synchronization for I²C Port can be used as a Handshake Mechanism to Suspend and Resume Serial Transfer (SCLREL control)
- I²C Supports Multi-Master Operation, Detects Bus Collision and Arbitrates Accordingly

19.1 Operating Modes

The hardware fully implements all the master and slave functions of the I²C Standard and Fast mode specifications, as well as 7-bit and 10-bit addressing.

The I²C module can operate either as a slave or a master on an I²C bus.

The following types of I²C operation are supported:

- I²C slave operation with 7-bit addressing
- I²C slave operation with 10-bit addressing
- I²C master operation with 7-bit or 10-bit addressing

For details about the communication sequence in each of these modes, refer to the "*dsPIC33/PIC24 Family Reference Manual*". Please see the Microchip web site (www.microchip.com) for the latest *"dsPIC33/PIC24 Family Reference Manual*" sections.

19.2 I²C Registers

I2CxCON and I2CxSTAT are control and status registers, respectively. The I2CxCON register is readable and writable. The lower six bits of I2CxSTAT are read-only. The remaining bits of the I2CSTAT are read/write:

- I2CxRSR is the shift register used for shifting data internal to the module and the user application has no access to it.
- I2CxRCV is the receive buffer and the register to which data bytes are written or from which data bytes are read.
- I2CxTRN is the transmit register to which bytes are written during a transmit operation.
- The I2CxADD register holds the slave address.
- A status bit, ADD10, indicates 10-Bit Addressing mode.
- The I2CxBRG acts as the Baud Rate Generator (BRG) reload value.

In receive operations, I2CxRSR and I2CxRCV together form a double-buffered receiver. When I2CxRSR receives a complete byte, it is transferred to I2CxRCV and an interrupt pulse is generated.

0 = EIDx bit is don’t care in filter comparison

22.3 Module Functionality

The High-Speed, 10-Bit ADC is designed to support power conversion applications when used with the High-Speed PWM module. The ADC may have one or two SAR modules, depending on the device variant. If two SARs are present on a device, two conversions can be processed at a time, yielding 4 Msps conversion rate. If only one SAR is present on a device, only one conversion can be processed at a time, yielding 2 Msps conversion rate. The High-Speed, 10-Bit ADC produces two 10-bit conversion results in a 0.5 microsecond.

The ADC module supports up to 24 external analog inputs and two internal analog inputs. To monitor reference voltage, two internal inputs, AN24 and AN25, are connected to EXTREF and INTREF, respectively.

The analog reference voltage is defined as the device supply voltage (AV_{DD}/AV_{SS}).

The ADC module uses the following control and status registers:

- ADCON: ADC Control Register
- ADSTAT: ADC Status Register
- ADBASE: ADC Base Register(1,2)
- ADPCFG: ADC Port Configuration Register
- ADPCFG2: ADC Port Configuration Register 2
- ADCPC0: ADC Convert Pair Control Register 0
- ADCPC1: ADC Convert Pair Control Register 1
- ADCPC2: ADC Convert Pair Control Register 2
- ADCPC3: ADC Convert Pair Control Register 3
- ADCPC4: ADC Convert Pair Control Register 4
- ADCPC5: ADC Convert Pair Control Register 5
- ADCPC6: ADC Convert Pair Control Register 6(2)

The ADCON register controls the operation of the ADC module. The ADSTAT register displays the status of the conversion processes. The ADPCFG registers configure the port pins as analog inputs or as digital I/O. The ADCPCx registers control the triggering of the ADC conversions. See Register 22-1 through Register 22-12 for detailed bit configurations.

Note:	A unique feature of the ADC module is its ability to sample inputs in an asynchronous manner. Individual Sample-and-Hold circuits can be triggered independently of each other.

REGISTER 22-9: ADCPC3: ADC CONVERT PAIR CONTROL REGISTER 3

bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **IRQEN7:** Interrupt Request Enable 7 bit
1 = Enables IRQ generation when requested conversion of Channels AN15 and AN14 is completed
0 = IRQ is not generated

bit 14 **PEND7:** Pending Conversion Status 7 bit
1 = Conversion of Channels AN15 and AN14 is pending; set when selected trigger is asserted
0 = Conversion is complete

bit 13 **SWTRG7:** Software Trigger 7 bit
1 = Starts conversion of AN15 and AN14 (if selected by the TRGSRCx<4:0> bits)**(1)**
This bit is automatically cleared by hardware when the PEND7 bit is set.
0 = Conversion has not started

Note 1: The trigger source must be set as an individual software trigger prior to setting this bit to '1'. If other conversions are in progress, the conversion is performed when the conversion resources are available.

25.0 INSTRUCTION SET SUMMARY

Note: This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the *"dsPIC33/PIC24 Family Reference Manual"*. Please see the Microchip web site (www.microchip.com) for the latest *"dsPIC33F/PIC24H Family Reference Manual"* sections. The information in this data sheet supersedes the information in the FRM.

The dsPIC33F instruction set is identical to that of the dsPIC30F.

Most instructions are a single program memory word (24 bits). Only three instructions require two program memory locations.

Each single-word instruction is a 24-bit word, divided into an 8-bit opcode, which specifies the instruction type and one or more operands, which further specify the operation of the instruction.

The instruction set is highly orthogonal and is grouped into five basic categories:

- Word or byte-oriented operations
- Bit-oriented operations
- Literal operations
- DSP operations
- Control operations

Table 25-1 shows the general symbols used in describing the instructions.

The dsPIC33F instruction set summary in Table 25-2 lists all the instructions, along with the status flags affected by each instruction.

Most word or byte-oriented W register instructions (including barrel shift instructions) have three operands:

- The first source operand, which is typically a register 'Wb' without any address modifier
- The second source operand, which is typically a register 'Ws' with or without an address modifier
- The destination of the result, which is typically a register 'Wd' with or without an address modifier

However, word or byte-oriented file register instructions have two operands:

- The file register specified by the value, 'f'
- The destination, which could be either the file register, 'f', or the W0 register, which is denoted as 'WREG'

Most bit-oriented instructions (including simple rotate/shift instructions) have two operands:

- The W register (with or without an address modifier) or file register (specified by the value of 'Ws' or 'f')
- The bit in the W register or file register (specified by a literal value or indirectly by the contents of register 'Wb')

The literal instructions that involve data movement can use some of the following operands:

- A literal value to be loaded into a W register or file register (specified by 'k')
- The W register or file register where the literal value is to be loaded (specified by 'Wb' or 'f')

However, literal instructions that involve arithmetic or logical operations use some of the following operands:

- The first source operand, which is a register 'Wb' without any address modifier
- The second source operand, which is a literal value
- The destination of the result (only if not the same as the first source operand), which is typically a register 'Wd' with or without an address modifier

The MAC class of DSP instructions can use some of the following operands:

- The accumulator (A or B) to be used (required operand)
- The W registers to be used as the two operands
- The X and Y address space prefetch operations
- The X and Y address space prefetch destinations
- The accumulator write-back destination

The other DSP instructions do not involve any multiplication and can include:

- The accumulator to be used (required)
- The source or destination operand (designated as Wso or Wdo, respectively) with or without an address modifier
- The amount of shift specified by a W register, 'Wn', or a literal value

The control instructions can use some of the following operands:

- A program memory address
- The mode of the Table Read and Table Write instructions

TABLE 27-7: DC CHARACTERISTICS: POWER-DOWN CURRENT (I_{PD})

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended			
Parameter No.	**Typical(1)**	**Max**	**Units**	**Conditions**		
Power-Down Current (I_{PD})(2,4)						
DC60d	50	500	µA	-40°C	3.3V	Base Power-Down Current
DC60a	50	500	µA	+25°C		
DC60b	200	500	µA	+85°C		
DC60c	600	1000	µA	+125°C		
DC61d	8	13	µA	-40°C	3.3V	Watchdog Timer Current: ΔI_{WDT}(3)
DC61a	10	15	µA	+25°C		
DC61b	12	20	µA	+85°C		
DC61c	13	25	µA	+125°C		

Note 1: Data in the Typical column is at 3.3V, +25°C unless otherwise stated.

2: I_{PD} (Sleep) current is measured as follows:

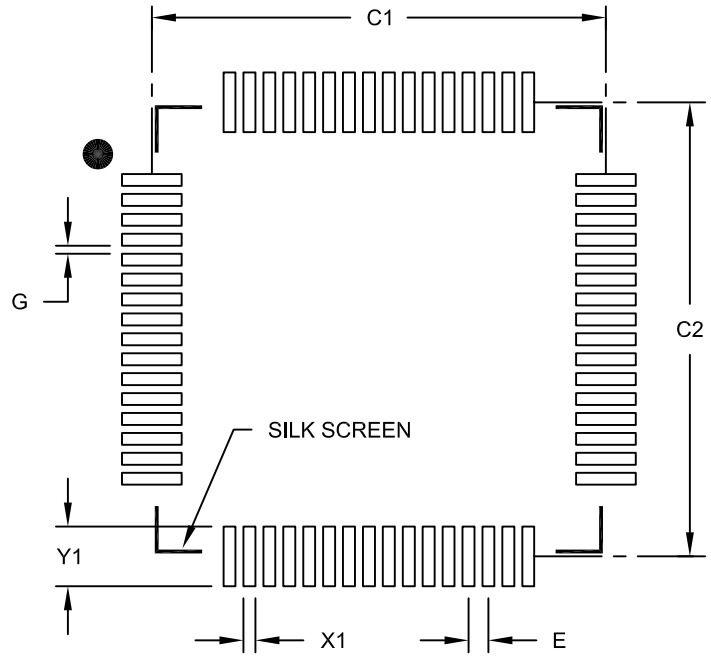
- CPU core is off, oscillator is configured in EC mode and external clock is active, OSC1 is driven with external square wave from rail-to-rail (EC clock overshoot/undershoot < 250 mV required)
- CLKO is configured as an I/O input pin in the Configuration Word
- All I/O pins are configured as inputs and pulled to V_{SS}
- $\overline{MCLR}$ = V_{DD}, WDT and FSCM are disabled
- All peripheral modules are disabled (all PMDx bits are all '1's)
- The VREGS bit (RCON<8>) = 0 (i.e., core regulator is set to standby while the device is in Sleep mode)
- JTAG disabled

3: The Δ current is the additional current consumed when the WDT module is enabled. This current should be added to the base I_{PD} current.

4: These currents are measured on the device containing the most memory in this family.

64-Lead Plastic Thin Quad Flatpack (PT) 10x10x1 mm Body, 2.00 mm Footprint [TQFP]

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging



RECOMMENDED LAND PATTERN

Units		MILLIMETERS		
Dimension Limits		MIN	NOM	MAX
Contact Pitch	E	0.50 BSC		
Contact Pad Spacing	C1		11.40	
Contact Pad Spacing	C2		11.40	
Contact Pad Width (X64)	X1			0.30
Contact Pad Length (X64)	Y1			1.50
Distance Between Pads	G	0.20
