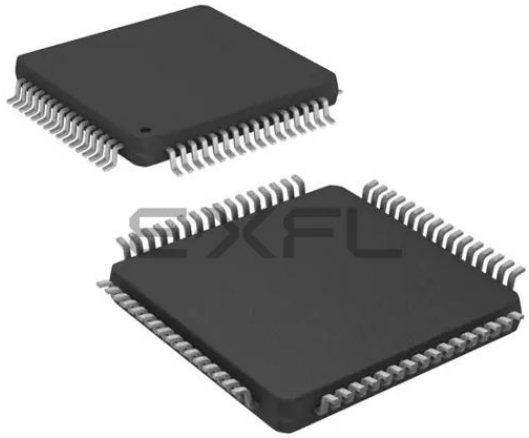
Microchip Technology - DSPIC33FJ64GS406T-I/PT Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

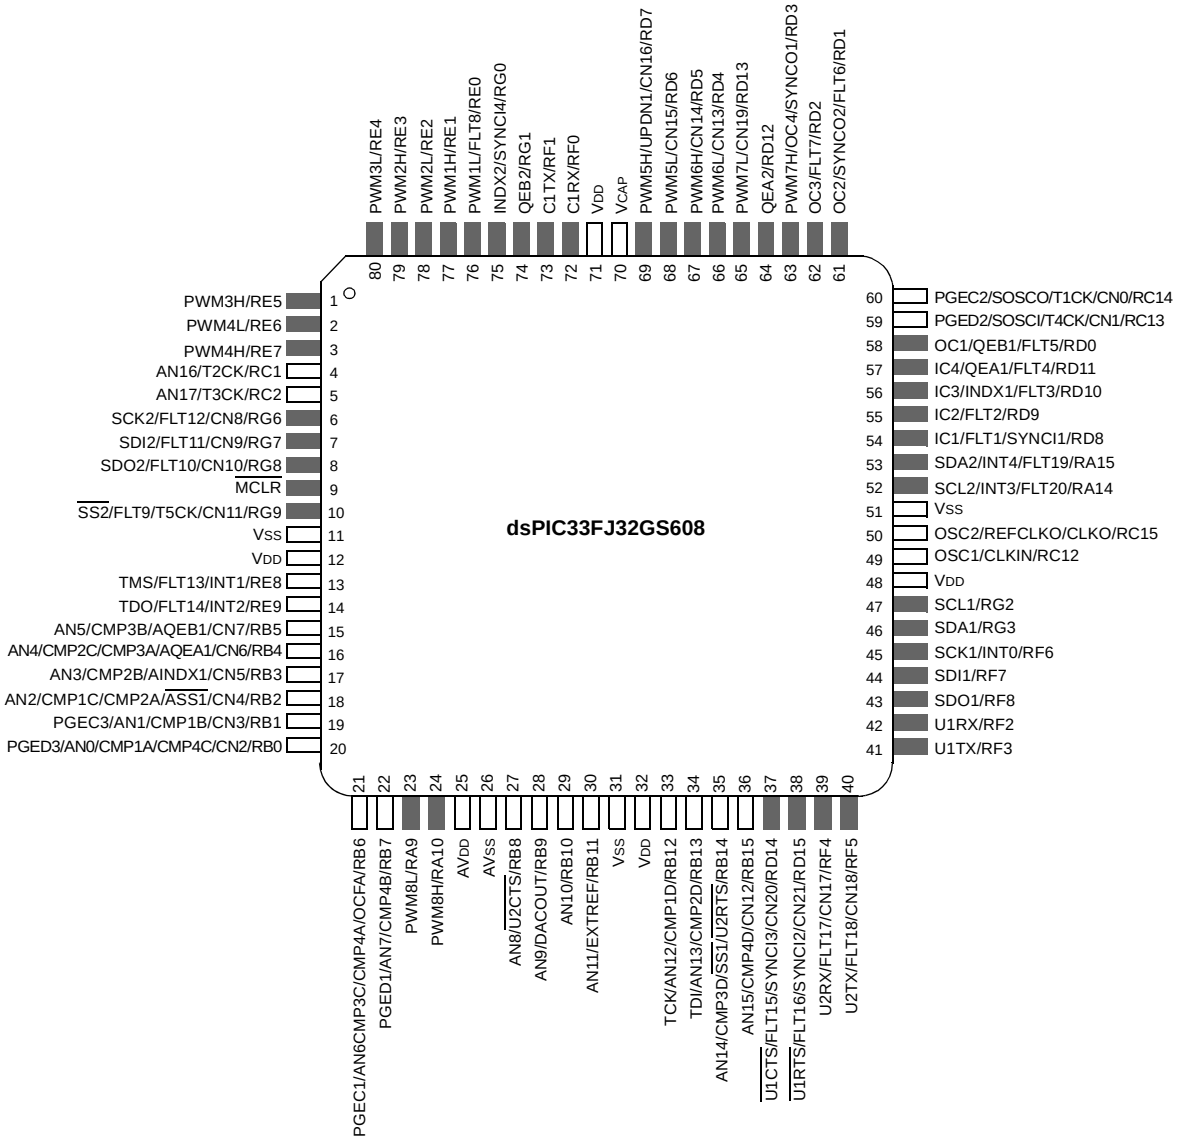
Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	40 MIPs
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, QEI, POR, PWM, WDT
Number of I/O	58
Program Memory Size	64KB (64K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	8K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 16x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-TQFP
Supplier Device Package	64-TQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic33fj64gs406t-i-pt

Pin Diagrams (Continued)

80-Pin TQFP

■ = Pins are up to 5V tolerant



4.0 MEMORY ORGANIZATION

Note: This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to the *dsPIC33/PIC24 Family Reference Manual*, **Program Memory"** (DS70203), which is available from the Microchip web site (www.microchip.com). The information in this data sheet supersedes the information in the FRM.

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 architecture features separate program and data memory spaces and buses. This architecture also allows the direct access to program memory from the data space during code execution.

4.1 Program Address Space

The program address memory space is 4M instructions. The space is addressable by a 24-bit value derived either from the 23-bit Program Counter (PC) during program execution, or from table operation or data space remapping as described in **Section 4.6 "Interfacing Program and Data Memory Spaces"**.

User application access to the program memory space is restricted to the lower half of the address range (0x000000 to 0x7FFFFF). The exception is the use of TBLRD/TBLWT operations, which use TBLPAG<7> to permit access to the Configuration bits and Device ID sections of the configuration memory space.

The memory maps are shown in Figure 4-1.

FIGURE 4-1: PROGRAM MEMORY MAPS FOR dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 DEVICES

5.2 RTSP Operation

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 Flash program memory array is organized into rows of 64 instructions or 192 bytes. RTSP allows the user application to erase a page of memory, which consists of eight rows (512 instructions) at a time, and to program one row or one word at a time. Table 27-12 shows typical erase and programming times. The 8-row erase pages and single row write rows are edge-aligned from the beginning of program memory, on boundaries of 1536 bytes and 192 bytes, respectively.

The program memory implements holding buffers that can contain 64 instructions of programming data. Prior to the actual programming operation, the write data must be loaded into the buffers sequentially. The instruction words loaded must always be from a group of 64 boundary.

The basic sequence for RTSP programming is to set up a Table Pointer, then do a series of TBLWT instructions to load the buffers. Programming is performed by setting the control bits in the NVMCON register. A total of 64 TBLWTL and TBLWTH instructions are required to load the instructions.

All of the Table Write operations are single-word writes (two instruction cycles) because only the buffers are written. A programming cycle is required for programming each row.

5.3 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. The processor stalls (waits) until the programming operation is finished.

The programming time depends on the FRC accuracy (see Table 27-20) and the value of the FRC Oscillator Tuning register (see Register 9-4). Use the following formula to calculate the minimum and maximum values for the Row Write Time, Page Erase Time and Word Write Cycle Time parameters (see Table 27-12).

EQUATION 5-1: PROGRAMMING TIME

$$\frac{T}{7.37\ MHz \times (FRC\ Accuracy)\% \times (FRC\ Tuning)\%}$$

For example, if the device is operating at +125°C, the FRC accuracy will be ±2%. If the TUN<5:0> bits (see Register 9-4) are set to 'b000000, the minimum row write time is equal to Equation 5-2.

EQUATION 5-2: MINIMUM ROW WRITE TIME

$$T_{RW} = \frac{11064\ Cycles}{7.37\ MHz \times (1 + 0.02) \times (1 - 0.000938)} = 1.473\ ms$$

The maximum row write time is equal to Equation 5-3.

EQUATION 5-3: MAXIMUM ROW WRITE TIME

$$T_{RW} = \frac{11064\ Cycles}{7.37\ MHz \times (1 - 0.02) \times (1 - 0.000938)} = 1.533\ ms$$

Setting the WR bit (NVMCON<15>) starts the operation and the WR bit is automatically cleared when the operation is finished.

5.4 Control Registers

Two SFRs are used to read and write the program Flash memory: NVMCON and NVMKEY.

The NVMCON register (Register 5-1) controls which blocks are to be erased, which memory type is to be programmed and the start of the programming cycle.

NVMKEY is a write-only register that is used for write protection. To start a programming or erase sequence, the user application must consecutively write 0x55 and 0xAA to the NVMKEY register. Refer to **Section 5.3 "Programming Operations"** for further details.

6.4 External Reset (EXTR)

The External Reset is generated by driving the MCLR pin low. The MCLR pin is a Schmitt Trigger input with an additional glitch filter. Reset pulses that are longer than the minimum pulse width will generate a Reset. Refer to **Section 27.0 "Electrical Characteristics"** for minimum pulse width specifications. The External Reset (MCLR) pin (EXTR) bit in the Reset Control (RCON) register is set to indicate the MCLR Reset.

6.4.1 EXTERNAL SUPERVISORY CIRCUIT

Many systems have external supervisory circuits that generate Reset signals to reset multiple devices in the system. This external Reset signal can be directly connected to the MCLR pin to reset the device when the rest of system is reset.

6.4.2 INTERNAL SUPERVISORY CIRCUIT

When using the internal power supervisory circuit to reset the device, the External Reset pin (MCLR) should be tied directly or resistively to VDD. In this case, the MCLR pin will not be used to generate a Reset. The External Reset pin (MCLR) does not have an internal pull-up and must not be left unconnected.

6.5 Software RESET Instruction (SWR)

Whenever the RESET instruction is executed, the device will assert SYSRST, placing the device in a special Reset state. This Reset state will not re-initialize the clock. The clock source in effect prior to the RESET instruction will remain. SYSRST is released at the next instruction cycle and the Reset vector fetch will commence.

The Software Reset (SWR) flag (instruction) in the Reset Control (RCON<6>) register is set to indicate the Software Reset.

6.6 Watchdog Timer Time-out Reset (WDTO)

Whenever a Watchdog Timer Time-out Reset occurs, the device will asynchronously assert SYSRST. The clock source will remain unchanged. A WDT time-out during Sleep or Idle mode will wake-up the processor, but will not reset the processor.

The Watchdog Timer Time-out (WDTO) flag in the Reset Control (RCON<4>) register is set to indicate the Watchdog Timer Reset. Refer to **Section 24.4 "Watchdog Timer (WDT)"** for more information on the Watchdog Timer Reset.

6.7 Trap Conflict Reset

If a lower priority hard trap occurs while a higher priority trap is being processed, a hard Trap Conflict Reset occurs. The hard traps include exceptions of Priority Level 13 through Level 15, inclusive. The address error (Level 13) and oscillator error (Level 14) traps fall into this category.

The Trap Reset (TRAPR) flag in the Reset Control (RCON<15>) register is set to indicate the Trap Conflict Reset. Refer to **Section 7.0 "Interrupt Controller"** for more information on Trap Conflict Resets.

6.8 Illegal Condition Device Reset

An illegal condition device Reset occurs due to the following sources:

- Illegal Opcode Reset
- Uninitialized W Register Reset
- Security Reset

The Illegal Opcode or Uninitialized W Access Reset (IOPUWR) flag in the Reset Control (RCON<14>) register is set to indicate the illegal condition device Reset.

6.8.1 ILLEGAL OPCODE RESET

A device Reset is generated if the device attempts to execute an illegal opcode value that is fetched from program memory.

The Illegal Opcode Reset function can prevent the device from executing program memory sections that are used to store constant data. To take advantage of the Illegal Opcode Reset, use only the lower 16 bits of each program memory section to store the data values. The upper 8 bits should be programmed with 3Fh, which is an illegal opcode value.

6.8.2 UNINITIALIZED W REGISTER RESET

Any attempt to use the Uninitialized W register as an Address Pointer will reset the device. The W register array (with the exception of W15) is cleared during all Resets and is considered uninitialized until written to.

6.8.3 SECURITY RESET

If a Program Flow Change (PFC) or Vector Flow Change (VFC) targets a restricted location in a protected segment (Boot and Secure Segment), that operation will cause a Security Reset.

The PFC occurs when the Program Counter is reloaded as a result of a call, jump, computed jump, return, return from subroutine or other form of branch instruction.

The VFC occurs when the Program Counter is reloaded with an interrupt or trap vector.

Refer to **Section 24.8 "Code Protection and CodeGuard™ Security"** for more information on Security Reset.

22.3 Module Functionality

The High-Speed, 10-Bit ADC is designed to support power conversion applications when used with the High-Speed PWM module. The ADC may have one or two SAR modules, depending on the device variant. If two SARs are present on a device, two conversions can be processed at a time, yielding 4 Msps conversion rate. If only one SAR is present on a device, only one conversion can be processed at a time, yielding 2 Msps conversion rate. The High-Speed, 10-Bit ADC produces two 10-bit conversion results in a 0.5 microsecond.

The ADC module supports up to 24 external analog inputs and two internal analog inputs. To monitor reference voltage, two internal inputs, AN24 and AN25, are connected to EXTREF and INTREF, respectively.

The analog reference voltage is defined as the device supply voltage (AV_{DD}/AV_{SS}).

The ADC module uses the following control and status registers:

- ADCON: ADC Control Register
- ADSTAT: ADC Status Register
- ADBASE: ADC Base Register(1,2)
- ADPCFG: ADC Port Configuration Register
- ADPCFG2: ADC Port Configuration Register 2
- ADCPC0: ADC Convert Pair Control Register 0
- ADCPC1: ADC Convert Pair Control Register 1
- ADCPC2: ADC Convert Pair Control Register 2
- ADCPC3: ADC Convert Pair Control Register 3
- ADCPC4: ADC Convert Pair Control Register 4
- ADCPC5: ADC Convert Pair Control Register 5
- ADCPC6: ADC Convert Pair Control Register 6(2)

The ADCON register controls the operation of the ADC module. The ADSTAT register displays the status of the conversion processes. The ADPCFG registers configure the port pins as analog inputs or as digital I/O. The ADCPCx registers control the triggering of the ADC conversions. See Register 22-1 through Register 22-12 for detailed bit configurations.

Note:	A unique feature of the ADC module is its ability to sample inputs in an asynchronous manner. Individual Sample-and-Hold circuits can be triggered independently of each other.

REGISTER 22-11: ADCPC5: ADC CONVERT PAIR CONTROL REGISTER 5 (CONTINUED)

bit 4-0 **TRGSRC10<4:0>:** Trigger 10 Source Selection bits
Selects trigger source for conversion of analog channels AN21 and AN20.
11111 = Timer2 period match

TABLE 27-9: DC CHARACTERISTICS: I/O PIN INPUT SPECIFICATIONS

DC CHARACTERISTICS			Standard Operating Conditions: 3.0V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ(1)**	**Max**	**Units**	**Conditions**
	VIL	**Input Low Voltage**					
DI10		I/O Pins	VSS	—	0.2 VDD	V	
DI15		$\overline{\text{MCLR}}$	VSS	—	0.2 VDD	V	
DI16		I/O Pins with OSC1 or SOSCI	VSS	—	0.2 VDD	V	
DI18		I/O Pins with SDAx, SCLx	VSS	—	0.3 VDD	V	SMBus disabled
DI19		I/O Pins with SDAx, SCLx	VSS	—	0.8	V	SMBus enabled
	VIH	**Input High Voltage**					
DI20		I/O Pins Non 5V Tolerant(4)	0.7 VDD	—	VDD	V	
DI21		I/O Pins 5V Tolerant(4)	0.7 VDD	—	5.5	V	
DI28		SDAx, SCLx	0.7 VDD	—	5.5	V	SMBus disabled
DI29		SDAx, SCLx	2.1	—	5.5	V	SMBus enabled
	ICNPU	**CNx Pull-up Current**					
DI30			—	250	—	μA	VDD = 3.3V, VPIN = VSS
	IIL	**Input Leakage Current(2,3,4)**					
DI50		I/O Pins with: 4x Driver Pins: RA0-RA7, RA14, RA15, RB0-RB15(10), RC1-RC4, RC12-RC14, RD0-RD2, RD8-RD12, RD14, RD15, RE8, RE9, RF0-RF8, RF12, RF13, RG0-RG3, RG6-RG9, RG14, RG15	—	—	±2	μA	VSS ≤ VPIN ≤ VDD, Pin at high-impedance
		8x Driver Pins: RC15	—	—	±4	μA	VSS ≤ VPIN ≤ VDD, Pin at high-impedance
		16x Driver Pins: RA9, RA10, RD3-RD7, RD13, RE0-RE7, RG12, RG13	—	—	±8	μA	VSS ≤ VPIN ≤ VDD, Pin at high-impedance
DI55		$\overline{\text{MCLR}}$	—	—	±2	μA	VSS ≤ VPIN ≤ VDD
DI56		OSC1	—	—	±2	μA	VSS ≤ VPIN ≤ VDD, XT and HS modes

Note 1: Data in "Typ" column is at 3.3V, +25°C unless otherwise stated.

2: The leakage current on the $\overline{\text{MCLR}}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

3: Negative current is defined as current sourced by the pin.

4: See the **"Pin Diagrams"** section for the list of 5V tolerant I/O pins.

5: VIL source < (VSS – 0.3). Characterized but not tested.

6: VIH source > (VDD + 0.3) for non-5V tolerant pins only.

7: Digital 5V tolerant pins do not have an internal high side diode to VDD, and therefore, cannot tolerate any "positive" input injection current.

8: Injection currents > | 0 | can affect the ADC results by approximately 4-6 counts.

9: Any number and/or combination of I/O pins not excluded under IICL or IICH conditions are permitted, provided the mathematical "absolute instantaneous" sum of the input injection currents from all pins do not exceed the specified limit. Characterized but not tested.

10: RB11 has also been tested up to ±8 μA test limits.
