What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

6.1 System Reset

The dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices have two types of Reset:

- Cold Reset
- Warm Reset

A Cold Reset is the result of a Power-on Reset (POR) or a Brown-out Reset (BOR). On a Cold Reset, the FNOSCx Configuration bits in the FOSC Configuration register select the device clock source.

A Warm Reset is the result of all the other Reset sources, including the RESET instruction. On Warm Reset, the device will continue to operate from the current clock source as indicated by the Current Oscillator Selection (COSC<2:0>) bits in the Oscillator Control (OSCCON<14:12>) register.

The device is kept in a Reset state until the system power supplies have stabilized at appropriate levels and the oscillator clock is ready. The sequence in which this occurs is described in Figure 6-2.

Note 1: T_{OSCD} = Oscillator start-up delay (1.1 μs max. for FRC, 70 μs max. for LPRC). Crystal oscillator start-up times vary with the crystal characteristics, load capacitance, etc.

2: T_{OST} = Oscillator Start-up Timer (OST) delay (1024 oscillator clock period). For example, T_{OST} = 102.4 μs for a 10 MHz crystal and T_{OST} = 32 ms for a 32 kHz crystal.

3: T_{LOCK} = PLL lock time (1.5 ms nominal) if PLL is enabled.

18.0 SERIAL PERIPHERAL INTERFACE (SPI)

Note 1: This data sheet summarizes the features of the dsPIC33FJ32GS406/606/608/610 and dsPIC33FJ64GS406/606/608/610 families of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **"Serial Peripheral Interface (SPI)"** (DS70005185) in the *"dsPIC33/PIC24 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com). The information in this data sheet supersedes the information in the FRM.

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The Serial Peripheral Interface (SPI) module is a synchronous serial interface useful for communicating with other peripheral or microcontroller devices. These peripheral devices can be serial EEPROMs, shift registers, display drivers, Analog-to-Digital Converters and so on. The SPI module is compatible with the Motorola® SPI and SIOP modules.

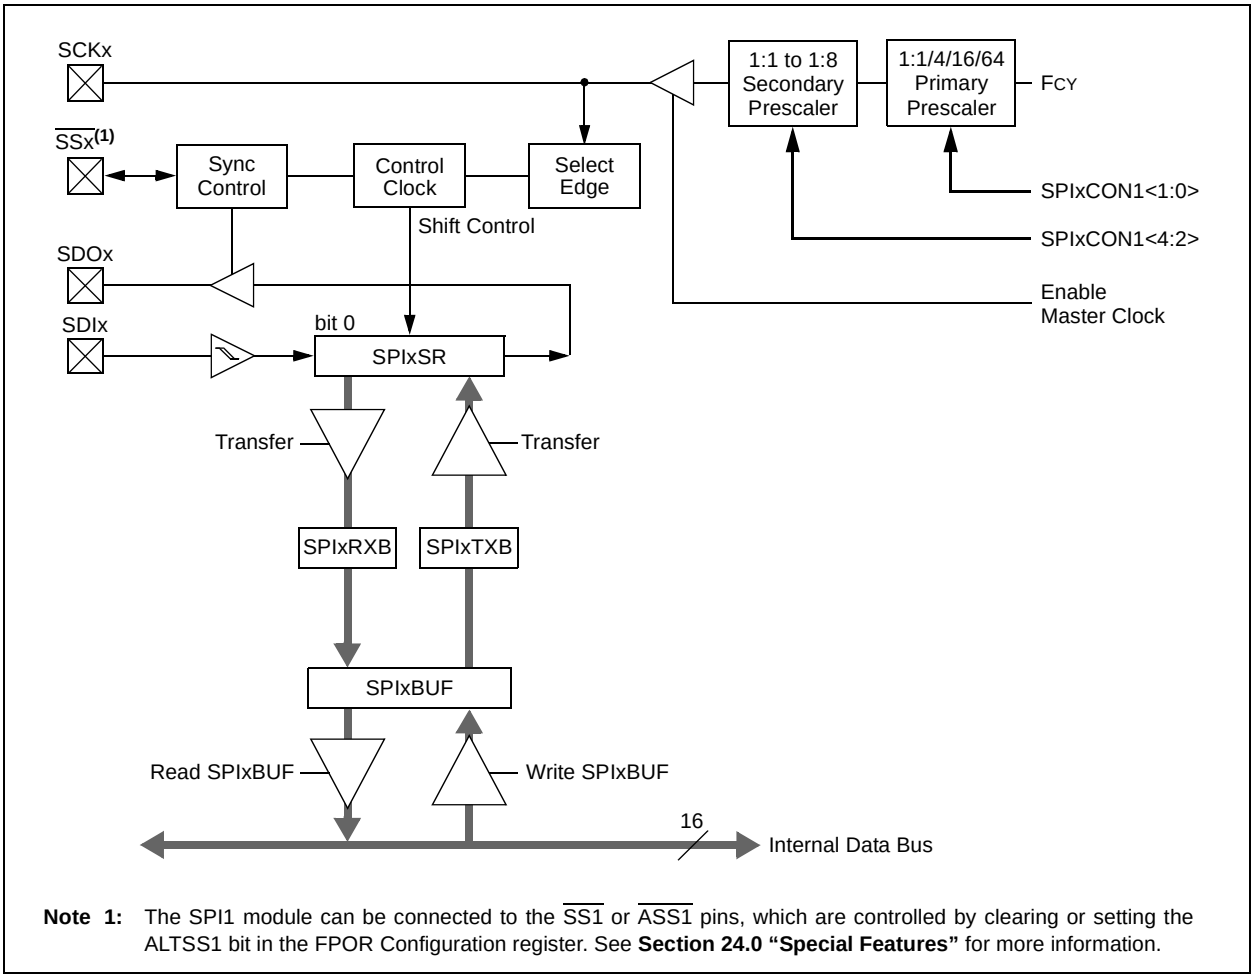
The SPI module consists of a 16-bit shift register, SPIxSR (where x = 1 or 2), used for shifting data in and out, and a buffer register, SPIxBUF. A control register, SPIxCON, configures the module. Additionally, a status register, SPIxSTAT, indicates status conditions.

The serial interface consists of these four pins:

- SDIx (Serial Data Input)
- SDOx (Serial Data Output)
- SCKx (Shift Clock Input Or Output)
- $\overline{SSx}$ (Active-Low Slave Select)

In Master mode operation, SCK is a clock output; in Slave mode, it is a clock input.

FIGURE 18-1: SPIx MODULE BLOCK DIAGRAM



Note 1: The SPI1 module can be connected to the $\overline{SS1}$ or $\overline{ASS1}$ pins, which are controlled by clearing or setting the ALTSS1 bit in the FPOR Configuration register. See **Section 24.0 "Special Features"** for more information.

bit 7 **IRQEN0:** Interrupt Request Enable 0 bit

1 = Enables IRQ generation when requested conversion of Channels AN1 and AN0 is completed
0 = IRQ is not generated

bit 6 **PEND0:** Pending Conversion Status 0 bit

1 = Conversion of Channels AN1 and AN0 is pending; set when selected trigger is asserted
0 = Conversion is complete

bit 5 **SWTRG0:** Software Trigger 0 bit

1 = Starts conversion of AN1 and AN0 (if selected by the TRGSRCx<4:0> bits)**(1)**
This bit is automatically cleared by hardware when the PEND0 bit is set.
0 = Conversion has not started.

Note 1: The trigger source must be set as an individual software trigger prior to setting this bit to '1'. If other conversions are in progress, the conversion is performed when the conversion resources are available.
