Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC G2_LE
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	400MHz
Co-Processors/DSP	Communications; RISC CPM
RAM Controllers	DRAM, SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100Mbps (2)
SATA	-
USB	USB 2.0 (1)
Voltage - I/O	3.3V
Operating Temperature	-40°C ~ 105°C (TA)
Security Features	-
Package / Case	516-BBGA
Supplier Device Package	516-PBGA (27x27)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/kmpc8247czqtiea

This figure shows the block diagram of the SoC.

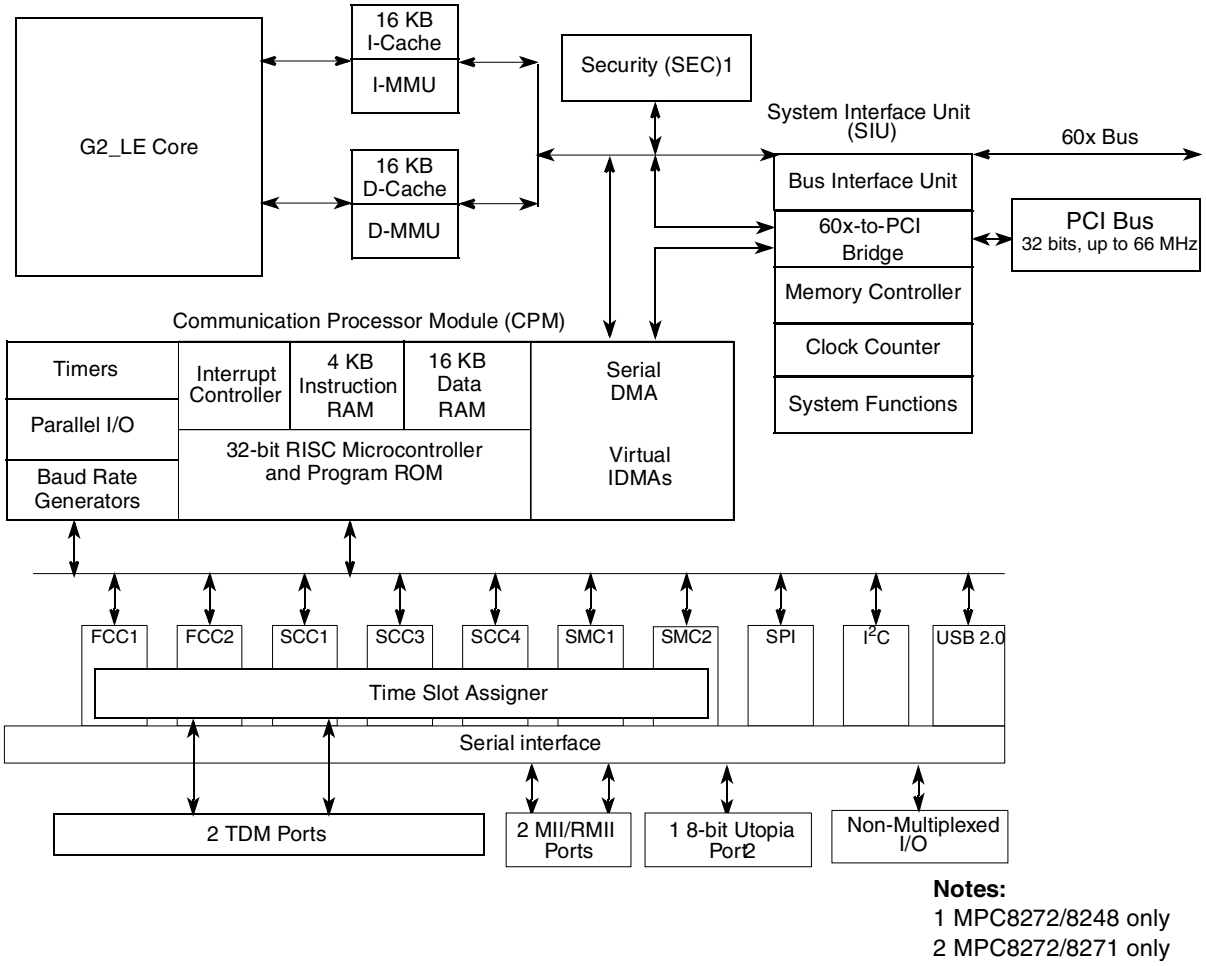

Figure 1. SoC Block Diagram

1.1 Features

The major features of the SoC are as follows:

- Dual-issue integer (G2_LE) core
  - A core version of the MPC603e microprocessor
  - System core microprocessor supporting frequencies of 266–400 MHz
  - Separate 16 KB data and instruction caches:
    - Four-way set associative
    - Physically addressed
    - LRU replacement algorithm
  - Power Architecture®-compliant memory management unit (MMU)
  - Common on-chip processor (COP) test interface
  - Supports bus snooping for cache coherency

Table 5. DC Electrical Characteristics[1] (continued)

Characteristic	Symbol	Min	Max	Unit
I_{OL} = 5.3mA CS[0–5] CS6/BCTL1/SMI CS7/TLBSYNC BADDR27/ IRQ1 BADDR28/ IRQ2 ALE/ IRQ4 BCTL0 PWE[0–7]/PSDDQM[0–7]/PBS[0–7] PSDA10/PGPL0 PSDWE/PGPL1 POE/PSDRAS/PGPL2 PSDCAS/PGPL3 PGTA/PUPMWAIT/PGPL4 PSDAMUX/PGPL5 PCI_CFG0 (PCI_HOST_EN) PCI_CFG1 (PCI_ARB_EN) PCI_CFG2 (DLL_ENABLE) MODCK1/RSRV/TC(0)/BNKSEL(0) MODCK2/CSE0/TC(1)/BNKSEL(1) MODCK3CSE1/TC(2)/BNKSEL(2)	V_{OL}	—	0.4	V
I_{OL} = 3.2mA PCI_PAR PCI_FRAME PCI_TRDY PCI_IRDY PCI_STOP PCI_DEVSEL PCI_IDSEL PCI_PERR PCI_SERR PCI_REQ0 PCI_REQ1/ CPI_HS_ES PCI_GNT0 PCI_GNT1/ CPI_HS_LES PCI_GNT2/ CPI_HS_ENUM PCI_RST PCI_INTA PCI_REQ2 DLLOUT PCI_AD(0-31) PCI_C(0–3)/BE(0-3) PA[8–31] PB[18–31] PC[0–1,4–29] PD[7–25, 29–31] TDO				

1 The default configuration of the CPM pins (PA[8–31], PB[18–31], PC[0–1,4–29], PD[7–25, 29–31]) is input. To prevent excessive DC current, it is recommended either to pull unused pins to GND or VDDH, or to configure them as outputs.

2 TCK, TRST and PORESET have min VIH = 2.5V.

3 V_{IL} for IIC interface does not match IIC standard, but does meet IIC standard for V_{OL} and should not cause any compatibility issue.

4 The leakage current is measured for nominal VDDH,VCCSYN, and VDD.

Table 6.

1 TCK, TRST and PORESET have min VIH = 2.5V.

2 The leakage current is measured for nominal VDDH,VCCSYN, and VDD.

3 V_{IL} for IIC interface does not match IIC standard, but does meet IIC standard for V_{OL} and should not cause any compatibility issue.

4.2 Estimation with Junction-to-Case Thermal Resistance

Historically, the thermal resistance has frequently been expressed as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

$R_{\theta JA}$ = junction-to-ambient thermal resistance (ºC/W)

$R_{\theta JC}$ = junction-to-case thermal resistance (ºC/W)

$R_{\theta CA}$ = case-to-ambient thermal resistance (ºC/W)

$R_{\theta JC}$ is device related and cannot be influenced by the user. The user adjusts the thermal environment to affect the case-to-ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the air flow around the device, add a heat sink, change the mounting arrangement on the printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device. This thermal model is most useful for ceramic packages with heat sinks where some 90% of the heat flows through the case and the heat sink to the ambient environment. For most packages, a better model is required.

4.3 Estimation with Junction-to-Board Thermal Resistance

A simple package thermal model which has demonstrated reasonable accuracy (about 20%) is a two-resistor model consisting of a junction-to-board and a junction-to-case thermal resistance. The junction-to-case thermal resistance covers the situation where a heat sink is used or where a substantial amount of heat is dissipated from the top of the package. The junction-to-board thermal resistance describes the thermal performance when most of the heat is conducted to the printed circuit board. It has been observed that the thermal performance of most plastic packages, especially PBGA packages, is strongly dependent on the board temperature.

If the board temperature is known, an estimate of the junction temperature in the environment can be made using the following equation:

$$T_J = T_B + (R_{\theta JB} \times P_D)$$

where:

$R_{\theta JB}$ = junction-to-board thermal resistance (ºC/W)

T_B = board temperature (ºC)

P_D = power dissipation in package

If the board temperature is known and the heat loss from the package case to the air can be ignored, acceptable predictions of junction temperature can be made. For this method to work, the board and board mounting must be similar to the test board used to determine the junction-to-board thermal resistance, namely a 2s2p (board with a power and a ground plane) and by attaching the thermal balls to the ground plane.

4.4 Estimation Using Simulation

When the board temperature is not known, a thermal simulation of the application is needed. The simple two-resistor model can be used with the thermal simulation of the application, or a more accurate and complex model of the package can be used in the thermal simulation.

4.5 Experimental Determination

To determine the junction temperature of the device in the application after prototypes are available, the thermal characterization parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

Ψ_{JT} = thermal characterization parameter

T_T = thermocouple temperature on top of package

P_D = power dissipation in package

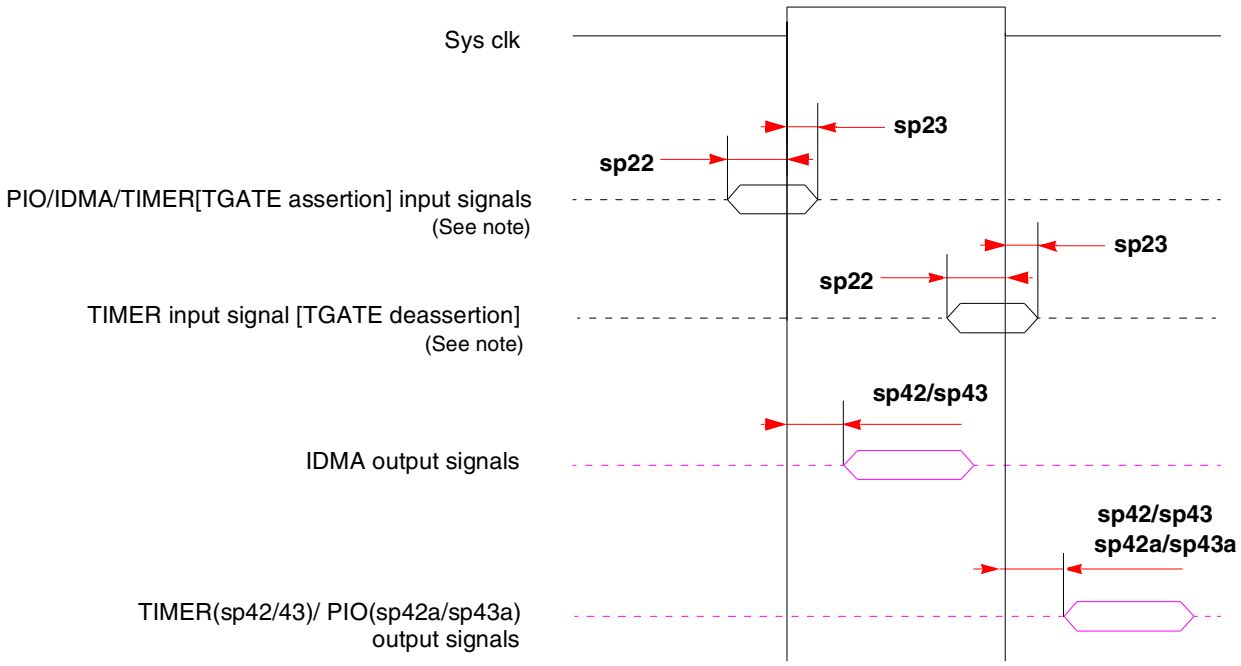
The thermal characterization parameter is measured per JEDEC JESD51-2 specification using a 40-gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the case to avoid measurement errors caused by cooling effects of the thermocouple wire.

4.6 Layout Practices

Each VDD and VDDH pin should be provided with a low-impedance path to the board's power supplies. Each ground pin should likewise be provided with a low-impedance path to ground. The power supply pins drive distinct groups of logic on chip. The VDD and VDDH power supplies should be bypassed to ground using bypass capacitors located as close as possible to the four sides of the package. For filtering high frequency noise, a capacitor of 0.1uF on each VDD and VDDH pin is recommended. Further, for medium frequency noise, a total of 2 capacitors of 47uF for VDD and 2 capacitors of 47uF for VDDH are also recommended. The capacitor leads and associated printed circuit traces connecting to chip VDD, VDDH and ground should be kept to less than half an inch per capacitor lead. Boards should employ separate inner layers for power and GND planes.

All output pins on the SoC have fast rise and fall times. Printed circuit (PC) trace interconnection length should be minimized to minimize overdamped conditions and reflections caused by these fast output switching times. This recommendation particularly applies to the address and data buses. Maximum PC trace lengths of six inches are recommended. Capacitance calculations should consider all device loads as well as parasitic capacitances due to the PC traces. Attention to proper PCB layout and bypassing becomes especially critical in systems with higher capacitive loads because these loads create higher transient currents in the VDD and GND circuits. Pull up all unused inputs or signals that will be inputs during reset. Special care should be taken to minimize the noise levels on the PLL supply pins.

This figure shows PIO and timer signals.



Note: TGATE is asserted on the rising edge of the clock; it is deasserted on the falling edge.

Figure 8. PIO and Timer Signal Diagram

6.2 SIU AC Characteristics

This table lists SIU input characteristics.

NOTE: CLKIN Jitter and Duty Cycle

The CLKIN input to the SoC should not exceed +/– 150 psec of jitter (peak-to-peak). This represents total input jitter—the combination of short term (peak-to-peak) and long term (cumulative). The duty cycle of CLKIN should not exceed the ratio of 40:60.

NOTE: Spread Spectrum Clocking

Spread spectrum clocking is allowed with 1% input frequency down-spread at maximum 60 KHz modulation rate regardless of input frequency.

NOTE: PCI AC Timing

The SoC meets the timing requirements of *PCI Specification Revision 2.2*. See Section 7, “Clock Configuration Modes,” and “Note: Tval (Output Hold)” to determine if a specific clock configuration is compliant.

7 Clock Configuration Modes

As shown in this table, the clocking mode is set according to two sources:

- PCI_CFG[0]— An input signal. Also defined as "$\overline{\text{PCI\_HOST\_EN}}$." See Chapter 6, "External Signals," and Chapter 9, "PCI Bridge," in the SoC reference manual.
- PCI_MODCK—Bit 27 in the Hard Reset Configuration Word. See Chapter 5, "Reset," in the SoC reference manual.

Table 16. SoC Clocking Modes

Pins		Clocking Mode	PCI Clock Frequency Range (MHz)	Reference
PCI_CFG[0][1]	PCI_MODCK[2]			
0	0	PCI host	50–66	Table 17
0	1		25–50	Table 18
1	0	PCI agent	50–66	Table 19
1	1		25–50	Table 20

1 PCI_HOST_EN
2 Determines PCI clock frequency range.

Within each mode, the configuration of bus, core, PCI, and CPM frequencies is determined by seven bits during the power-on reset—three hardware configuration pins (MODCK[1–3]) and four bits from hardware configuration word[28–31] (MODCK_H). Both the PLLs and the dividers are set according to the selected clock operation mode as described in the following sections.

NOTE

Clock configurations change only after $\overline{\text{PORESET}}$ is asserted.

NOTE: Tval (Output Hold)

The minimum Tval = 2 ns when PCI_MODCK = 1, and the minimum Tval = 1 ns when PCI_MODCK = 0. Therefore, designers should use clock configurations that fit this condition to achieve PCI-compliant AC timing.

7.1 PCI Host Mode

These tables show configurations for PCI host mode. The frequency values listed are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. Note that in PCI host mode the input clock is the bus clock.

Table 17. Clock Configurations for PCI Host Mode (PCI_MODCK=0)[1,2]

Mode[3]	Bus Clock (MHz)		CPM Multiplication Factor[4]	CPM Clock (MHz)		CPU Multiplication Factor[5]	CPU Clock (MHz)		PCI Division Factor[6]	PCI Clock (MHz)

1100_010	Reserved										

1 The “low” values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The “high” values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user’s device. The minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. The minimum CPM frequency is 120 MHz.

2 PCI_MODCK determines the PCI clock frequency range. See Table 17 for higher range configurations.

3 MODCK_H = hard reset configuration word [28–31] (see Section 5.4 in the SoC reference manual). MODCK[1-3] = three hardware configuration pins.

4 CPM multiplication factor = CPM clock/bus clock

5 CPU multiplication factor = Core PLL multiplication factor

6 CPM_CLK/PCI_CLK ratio. When PCI_MODCK = 1, the ratio of CPM_CLK/PCI_CLK should be calculated from PCIDF as follows:
PCIDF = 3 > CPM_CLK/PCI_CLK = 4
PCIDF = 5 > CPM_CLK/PCI_CLK = 6
PCIDF = 7 > CPM_CLK/PCI_CLK = 8
PCIDF = 9 > CPM_CLK/PCI_CLK = 5
PCIDF = B > CPM_CLK/PCI_CLK = 6

7.2 PCI Agent Mode

These tables show configurations for PCI agent mode. The frequency values listed are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. Note that in PCI agent mode the input clock is PCI clock.

Table 19. Clock Configurations for PCI Agent Mode (PCI_MODCK=0)[1,2]

Mode[3]	PCI Clock (MHz)		CPM Multiplication Factor[4]	CPM Clock (MHz)		CPU Multiplication Factor[5]	CPU Clock (MHz)		Bus Division Factor	Bus Clock (MHz)	
MODCK_H-MODCK[1-3]	Low	High		Low	High		Low	High		Low	High
Default Modes (MODCK_H=0000)

1 The “low” values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The “high” values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user’s device. The minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. The minimum CPM frequency is 120 MHz.

2 PCI_MODCK determines the PCI clock frequency range. See Table 19 for higher range configurations.

3 MODCK_H = hard reset configuration word [28–31] (see Section 5.4 in the SoC reference manual). MODCK[1-3] = three hardware configuration pins.

4 CPM multiplication factor = CPM clock/bus clock

5 CPU multiplication factor = Core PLL multiplication factor

8 Pinout

This figure and table show the pin assignments and pinout for the 516 PBGA package.

9 Package Description

This figure shows the side profile of the PBGA package to indicate the direction of the top surface view.

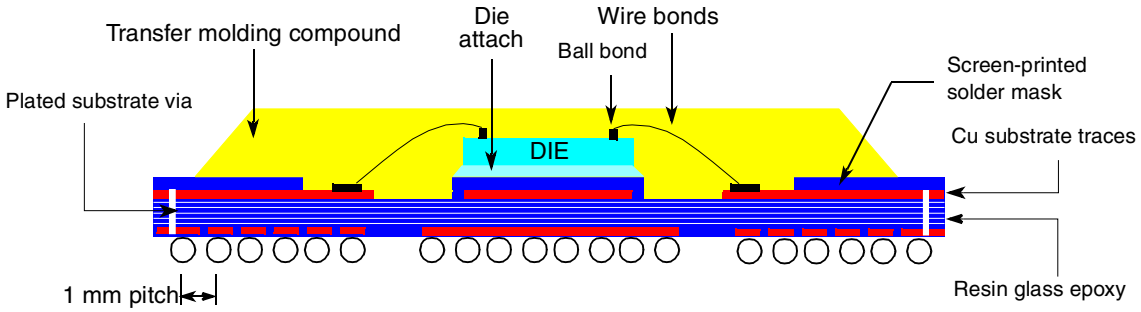

Figure 13. Side View of the PBGA Package Remove

9.1 Package Parameters

This table provides package parameters.

Table 22. Package Parameters

Code	Type	Outline (mm)	Interconnects	Pitch (mm)	Nominal Unmounted Height (mm)
VR, ZQ	PBGA	27 x 27	516	1	2.25

NOTE: Temperature Reflow for the VR Package

In the VR package, sphere composition is lead-free (see Table 2). This requires higher temperature reflow than what is required for other PowerQUICC II packages. Consult “Freescale PowerQUICC II Pb-Free Packaging Information” (MPC8250PBFREEPKG) available on www.freescale.com.

10 Ordering Information

This figure provides an example of the Freescale part numbering nomenclature for the SoC. In addition to the processor frequency, the part numbering scheme also consists of a part modifier that indicates any enhancement(s) in the part from the original production design. Each part number also contains a revision code that refers to the die mask revision number and is specified in the part numbering scheme for identification purposes only. For more information, contact your local Freescale sales office.

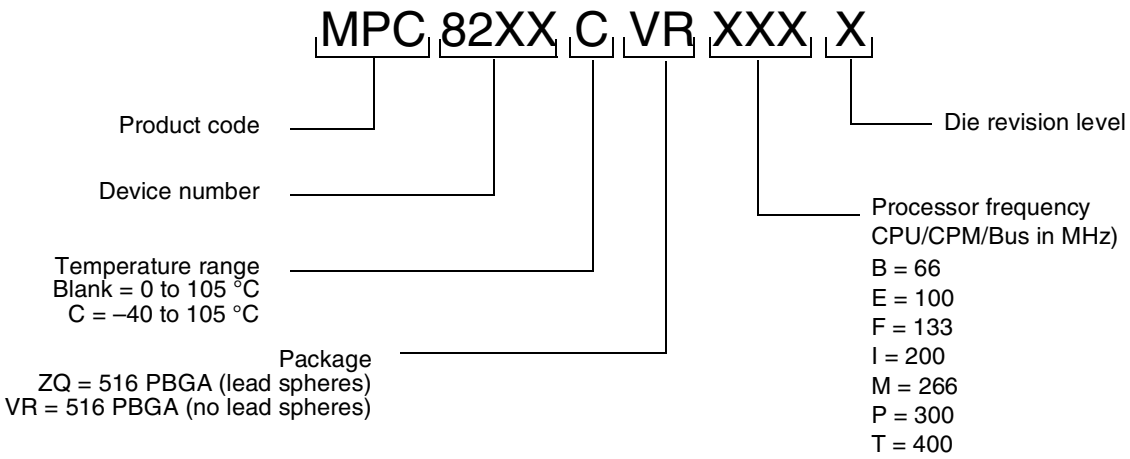

Figure 15. Freescale Part Number Key

11 Document Revision History

This table summarizes changes to this document.

Table 23. Document Revision History

Revision	Date	Substantive Changes
3	09/2011	In Figure 15, “Freescale Part Number Key,” added speed decoding information below processor frequency information.
2	12/2008	• Modified Figure 5, “SCC/SMC/SPI/I2C External Clock Diagram,” and added second section of figure notes. • In Table 12, modified “Data bus in pipeline mode” row and showed 66 MHz as “N/A.” • In Section 10, “Ordering Information,” added “F = 133” to CPU/CPM/Bus Frequency. • Added footnote concerning CPM_CLK/PCI_CLK ratio to column “PCI Division Factor” in Table 17, “Clock Configurations for PCI Host Mode (PCI_MODCK=0),” and Table 18, “Clock Configurations for PCI Host Mode (PCI_MODCK=1),.” • Removed overbar from DLL_ENABLE in Table 21, “Pinout.”
1.5	12/2006	• Section 6, “AC Electrical Characteristics,” removed deratings statement and clarified AC timing descriptions.
1.4	05/2006	• Added row for 133 MHz configurations to Table 8.
1.3	02/2006	• Inserted Section 6.3, “JTAG Timings.”
