

#### Welcome to E-XFL.COM

#### Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

#### Applications of **Embedded - Microprocessors**

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

#### Details

| Product Status                  | Obsolete   |

## Table 1. MPC8272 PowerQUICC II Family Functionality

<sup>1</sup> See Table 2.

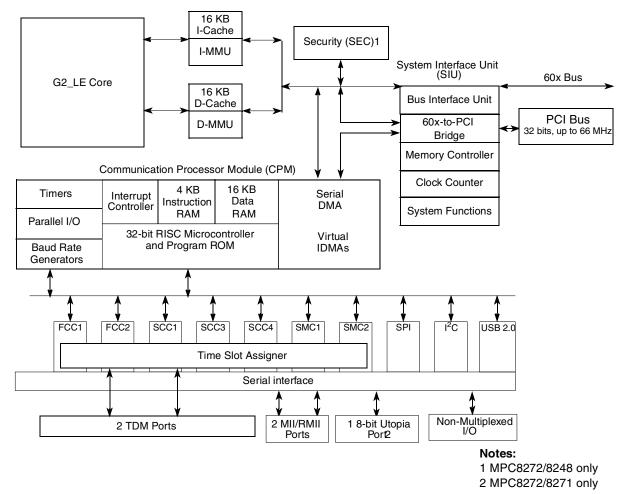

Devices in the MPC8272 family are available in two packages—the VR or ZQ package—as shown in . For package ordering information, see Section 10, "Ordering Information."

| Code<br>(Package) | VR<br>(516 PBGA—Lead free) | ZQ<br>(516 PBGA—Lead spheres) |
|-------------------|----------------------------|-------------------------------|
|                   | MPC8272VR                  | MPC8272ZQ                     |
| Device            | MPC8248VR                  | MPC8248ZQ                     |
|                   | MPC8271VR                  | MPC8271ZQ                     |
|                   | MPC8247VR                  | MPC8247ZQ                     |

Table 2. MPC8272 PowerQUICC II Device Packages

This figure shows the block diagram of the SoC.

# 1.1 Features

The major features of the SoC are as follows:

- Dual-issue integer (G2\_LE) core
  - A core version of the MPC603e microprocessor
  - System core microprocessor supporting frequencies of 266–400 MHz
  - Separate 16 KB data and instruction caches:
    - Four-way set associative
    - Physically addressed
    - LRU replacement algorithm
  - Power Architecture®-compliant memory management unit (MMU)
  - Common on-chip processor (COP) test interface
  - Supports bus snooping for cache coherency

Overview

- Floating-point unit (FPU) supports floating-point arithmetic
- Support for cache locking
- Low-power consumption
- Separate power supply for internal logic (1.5 V) and for I/O (3.3 V)
- Separate PLLs for G2\_LE core and for the communications processor module (CPM)
  - G2\_LE core and CPM can run at different frequencies for power/performance optimization
  - Internal core/bus clock multiplier that provides ratios 2:1, 2.5:1, 3:1, 3.5:1, 4:1, 4.5:1, 5:1, 5.5:1, 6:1, 7:1, 8:1
  - Internal CPM/bus clock multiplier that provides ratios 2:1, 2.5:1, 3:1, 3.5:1, 4:1, 5:1, 6:1, 8:1 ratios
- 64-bit data and 32-bit address 60x bus
  - Bus supports multiple master designs—up to two external masters
  - Supports single transfers and burst transfers
  - 64-, 32-, 16-, and 8-bit port sizes controlled by on-chip memory controller
- 60x-to-PCI bridge
  - Programmable host bridge and agent
  - 32-bit data bus, 66 MHz, 3.3 V
  - Synchronous and asynchronous 60x and PCI clock modes
  - All internal address space available to external PCI host
  - DMA for memory block transfers
    - PCI-to-60x address remapping
- System interface unit (SIU)
  - Clock synthesizer
  - Reset controller
  - Real-time clock (RTC) register
  - Periodic interrupt timer
  - Hardware bus monitor and software watchdog timer
  - IEEE 1149.1 JTAG test access port
- Eight bank memory controller
  - Glueless interface to SRAM, page mode SDRAM, DRAM, EPROM, Flash, and other user-definable peripherals
  - Byte write enables
  - 32-bit address decodes with programmable bank size
  - Three user-programmable machines, general-purpose chip-select machine, and page mode pipeline SDRAM machine
  - Byte selects for 64-bit bus width (60x)
  - Dedicated interface logic for SDRAM
- Disable CPU mode

Overview

- One of the FCCs supports ATM (MPC8272 and MPC8271 only)—full-duplex SAR at 155 Mbps, 8-bit UTOPIA interface 31 Mphys, AAL5, AAL1, AAL2, AAL0 protocols, TM 4.0 CBR, VBR, UBR, ABR traffic types, up to 64-K external connections
- Three serial communications controllers (SCCs) identical to those on the MPC860 supporting the digital portions of the following protocols:
  - Ethernet/IEEE 802.3 CDMA/CS
  - HDLC/SDLC and HDLC bus
  - Universal asynchronous receiver transmitter (UART)
  - Synchronous UART
  - Binary synchronous (BiSync) communications
  - Transparent
  - QUICC multichannel controller (QMC) up to 64 channels
    - Independent transmit and receive routing, frame synchronization.
    - Serial-multiplexed (full-duplex) input/output 2048, 1544, and 1536 Kbps PCM highways
    - Compatible with T1/DS1 24-channel and CEPT E1 32-channel PCM highway, ISDN basic rate, ISDN primary rate, and user defined.
    - Subchanneling on each time slot.
    - Independent transmit and receive routing, frame synchronization and clocking
    - Concatenation of any not necessarily consecutive time slots to channels independently for receiver/transmitter
    - Supports H1,H11, and H12 channels
    - Allows dynamic allocation of channels
  - SCC3 in NMSI mode is not usable when USB is enabled.
- Two serial management controllers (SMCs), identical to those of the MPC860
  - Provides management for BRI devices as general-circuit interface (GCI) controllers in time-division-multiplexed (TDM) channels
  - Transparent
  - UART (low-speed operation)
- One serial peripheral interface identical to the MPC860 SPI
- One  $I^2C$  controller (identical to the MPC860  $I^2C$  controller)
  - Microwire compatible
  - Multiple-master, single-master, and slave modes
- Up to two TDM interfaces
  - Supports one groups of two TDM channels
  - 1024 bytes of SI RAM
- Eight independent baud rate generators and 14 input clock pins for supplying clocks to FCC, SCC, SMC, and USB serial channels
- Four independent 16-bit timers that can be interconnected as two 32-bit timers

#### **Operating Conditions**

I/O supply voltage

Junction temperature (maximum)

Input voltage

 Caution: These are the recommended and tested operating conditions. Proper operation outside of these conditions is not guaranteed.
 State
 State

<sup>2</sup> Note that for extended temperature parts the range is  $(-40)_{T_A} - 105_{T_i}$ .

This SoC contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (either GND or  $V_{CC}$ ).

This figure shows the undershoot and overshoot voltage of the 60x bus memory interface of the SoC. Note that in PCI mode the I/O interface is different.

Thermal Characteristics

# 4.4 Estimation Using Simulation

When the board temperature is not known, a thermal simulation of the application is needed. The simple two-resistor model can be used with the thermal simulation of the application, or a more accurate and complex model of the package can be used in the thermal simulation.

# 4.5 **Experimental Determination**

To determine the junction temperature of the device in the application after prototypes are available, the thermal characterization parameter ( $\Psi_{JT}$ ) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

 $\Psi_{JT}$  = thermal characterization parameter

 $T_T$  = thermocouple temperature on top of package

 $P_D$  = power dissipation in package

The thermal characterization parameter is measured per JEDEC JESD51-2 specification using a 40-gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the case to avoid measurement errors caused by cooling effects of the thermocouple wire.

# 4.6 Layout Practices

Each VDD and VDDH pin should be provided with a low-impedance path to the board's power supplies. Each ground pin should likewise be provided with a low-impedance path to ground. The power supply pins drive distinct groups of logic on chip. The VDD and VDDH power supplies should be bypassed to ground using bypass capacitors located as close as possible to the four sides of the package. For filtering high frequency noise, a capacitor of 0.1uF on each VDD and VDDH pin is recommended. Further, for medium frequency noise, a total of 2 capacitors of 47uF for VDD and 2 capacitors of 47uF for VDDH are also recommended. The capacitor leads and associated printed circuit traces connecting to chip VDD, VDDH and ground should be kept to less than half an inch per capacitor lead. Boards should employ separate inner layers for power and GND planes.

All output pins on the SoC have fast rise and fall times. Printed circuit (PC) trace interconnection length should be minimized to minimize overdamped conditions and reflections caused by these fast output switching times. This recommendation particularly applies to the address and data buses. Maximum PC trace lengths of six inches are recommended. Capacitance calculations should consider all device loads as well as parasitic capacitances due to the PC traces. Attention to proper PCB layout and bypassing becomes especially critical in systems with higher capacitive loads because these loads create higher transient currents in the VDD and GND circuits. Pull up all unused inputs or signals that will be inputs during reset. Special care should be taken to minimize the noise levels on the PLL supply pins.

This table lists CPM input characteristics.

#### NOTE: Rise/Fall Time on CPM Input Pins

It is recommended that the rise/fall time on CPM input pins should not exceed 5 ns. This should be enforced especially on clock signals. Rise time refers to signal transitions from 10% to 90% of VCC; fall time refers to transitions from 90% to 10% of VCC.

| Spec N | lumber |  | Value (ns) |           |            |            |           |           |            |            |  |  |
|--------|--------|--|------------|-----------|------------|------------|-----------|-----------|------------|------------|--|--|
|        |        | Characteristic                               |            | Se        | tup        |            | Hold      |           |            |            |  |  |

### Table 11. AC Characteristics for CPM Inputs<sup>1</sup>

<sup>1</sup> Input specifications are measured from the 50% level of the signal to the 50% level of the rising edge of CLKIN. Timings are measured at the pin.

### NOTE

Although the specifications generally reference the rising edge of the clock, the following AC timing diagrams also apply when the falling edge is the active edge.

This figure shows the FCC internal clock.

#### Table 20. Clock Configurations for PCI Agent Mode (PCI\_MODCK=1)<sup>1,2</sup> (continued)

<sup>1</sup> The "low" values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The "high" values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. The minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. The minimum CPM frequency is 120 MHz.

<sup>2</sup> PCI\_MODCK determines the PCI clock frequency range. See Table 19 for higher range configurations.

<sup>3</sup> MODCK\_H = hard reset configuration word [28–31] (see Section 5.4 in the SoC reference manual). MODCK[1-3] = three hardware configuration pins.

<sup>4</sup> CPM multiplication factor = CPM clock/bus clock

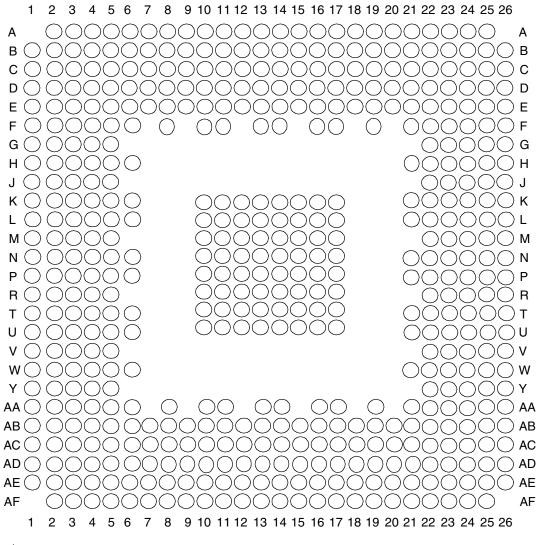

<sup>5</sup> CPU multiplication factor = Core PLL multiplication factor

# 8 Pinout

This figure and table show the pin assignments and pinout for the 516 PBGA package.

This figure shows the pinout of the 516 PBGA package as viewed from the top surface.

Not to Scale

Figure 12. Pinout of the 516 PBGA Package (View from Top)

This table lists the pins of the MPC8272. Note that the pins in the "MPC8272/8271 Only" column relate to Utopia functionality.

| Table 2 | 21. P | inout |
