Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

1.1 Features

The major features of the SoC are as follows:

- Dual-issue integer (G2_LE) core
  - A core version of the MPC603e microprocessor
  - System core microprocessor supporting frequencies of 266–400 MHz
  - Separate 16 KB data and instruction caches:
    - Four-way set associative
    - Physically addressed
    - LRU replacement algorithm
  - Power Architecture®-compliant memory management unit (MMU)
  - Common on-chip processor (COP) test interface
  - Supports bus snooping for cache coherency

  - Floating-point unit (FPU) supports floating-point arithmetic
  - Support for cache locking
- Low-power consumption
- Separate power supply for internal logic (1.5 V) and for I/O (3.3 V)
- Separate PLLs for G2_LE core and for the communications processor module (CPM)
  - G2_LE core and CPM can run at different frequencies for power/performance optimization
  - Internal core/bus clock multiplier that provides ratios 2:1, 2.5:1, 3:1, 3.5:1, 4:1, 4.5:1, 5:1, 5.5:1, 6:1, 7:1, 8:1
  - Internal CPM/bus clock multiplier that provides ratios 2:1, 2.5:1, 3:1, 3.5:1, 4:1, 5:1, 6:1, 8:1 ratios
- 64-bit data and 32-bit address 60x bus
  - Bus supports multiple master designs—up to two external masters
  - Supports single transfers and burst transfers
  - 64-, 32-, 16-, and 8-bit port sizes controlled by on-chip memory controller
- 60x-to-PCI bridge
  - Programmable host bridge and agent
  - 32-bit data bus, 66 MHz, 3.3 V
  - Synchronous and asynchronous 60x and PCI clock modes
  - All internal address space available to external PCI host
  - DMA for memory block transfers
    - PCI-to-60x address remapping
- System interface unit (SIU)
  - Clock synthesizer
  - Reset controller
  - Real-time clock (RTC) register
  - Periodic interrupt timer
  - Hardware bus monitor and software watchdog timer
  - IEEE 1149.1 JTAG test access port
- Eight bank memory controller
  - Glueless interface to SRAM, page mode SDRAM, DRAM, EPROM, Flash, and other user-definable peripherals
  - Byte write enables
  - 32-bit address decodes with programmable bank size
  - Three user-programmable machines, general-purpose chip-select machine, and page mode pipeline SDRAM machine
  - Byte selects for 64-bit bus width (60x)
  - Dedicated interface logic for SDRAM
- Disable CPU mode

- PCI bridge
  - PCI Specification revision 2.2-compliant and supports frequencies up to 66 MHz
  - On-chip arbitration
  - Support for PCI to 60x memory and 60x memory to PCI streaming
  - PCI host bridge or peripheral capabilities
  - Includes four DMA channels for the following transfers:
    - PCI-to-60x to 60x-to-PCI
    - 60x-to-PCI to PCI-to-60x
    - PCI-to-60x to PCI-to-60x
    - 60x-to-PCI to 60x-to-PCI
  - Includes the configuration registers required by the PCI standard (which are automatically loaded from the EPROM to configure the MPC8272) and message and doorbell registers
  - Supports the I_2O standard
  - Hot-Swap friendly (supports the Hot Swap Specification as defined by PICMG 2.1 R1.0 August 3, 1998)
  - Support for 66 MHz, 3.3 V specification
  - 60x-PCI bus core logic, which uses a buffer pool to allocate buffers for each port

2 Operating Conditions

This table shows the maximum electrical ratings.

Table 3. Absolute Maximum Ratings[1]

Rating	Symbol	Value	Unit
Core supply voltage[2]	VDD	–0.3 – 2.25	V
PLL supply voltage[2]	VCCSYN	–0.3 – 2.25	V
I/O supply voltage[3]	VDDH	–0.3 – 4.0	V
Input voltage[4]	VIN	GND(–0.3) – 3.6	V
Junction temperature	T_j	120	°C
Storage temperature range	T_{STG}	(–55) – (+150)	°C

1 Absolute maximum ratings are stress ratings only; functional operation (see Table 4) at the maximums is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage.

2 **Caution:** VDD/VCCSYN must not exceed VDDH by more than 0.4 V during normal operation. It is recommended that VDD/VCCSYN should be raised before or simultaneous with VDDH during power-on reset. VDD/VCCSYN may exceed VDDH by more than 0.4 V during power-on reset for no more than 100 ms.

3 **Caution:** VDDH can exceed VDD/VCCSYN by 3.3 V during power on reset by no more than 100 mSec. VDDH should not exceed VDD/VCCSYN by more than 2.5 V during normal operation.

4 **Caution:** VIN must not exceed VDDH by more than 2.5 V at any time, including during power-on reset.

This table lists recommended operational voltage conditions.

Table 4. Recommended Operating Conditions[1]

Rating	Symbol	Value	Unit
Core supply voltage	VDD	1.425 – 575	V
PLL supply voltage	VCCSYN	1.425 – 575	V
I/O supply voltage	VDDH	3.135 – 3.465	V
Input voltage	VIN	GND (–0.3) – 3.465	V
Junction temperature (maximum)	T_j	105[2]	°C
Ambient temperature	T_A	0–70[2]	°C

1 **Caution:** These are the recommended and tested operating conditions. Proper operation outside of these conditions is not guaranteed.

2 Note that for extended temperature parts the range is $(-40)_{T_A}$ – 105_{T_j}.

This SoC contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (either GND or V_{CC}).

This figure shows the undershoot and overshoot voltage of the 60x bus memory interface of the SoC. Note that in PCI mode the I/O interface is different.

4 Thermal Characteristics

This table describes thermal characteristics. See Table 2 for information on a given SoC's package. Discussions of each characteristic are provided in Section 4.1, "Estimation with Junction-to-Ambient Thermal Resistance," through Section 4.7, "References." For the these discussions, $P_D = (V_{DD} \times I_{DD}) +$ PI/O, where PI/O is the power dissipation of the I/O drivers.

Table 7. Thermal Characteristics

Junction-to-case[3]	$R_{\theta JC}$	8	°C/W	—
Junction-to-package top[4]	$R_{\theta JT}$	2	°C/W	—

1 Assumes no thermal vias
2 Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
3 Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
4 Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

4.1 Estimation with Junction-to-Ambient Thermal Resistance

An estimation of the chip junction temperature, T_J, in C can be obtained from the following equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

T_A = ambient temperature (ºC)
$R_{\theta JA}$ = package junction-to-ambient thermal resistance (ºC/W)
P_D = power dissipation in package

The junction-to-ambient thermal resistance is an industry standard value that provides a quick and easy estimation of thermal performance. However, the answer is only an estimate; test cases have demonstrated that errors of a factor of two (in the quantity $T_J - T_A$) are possible.

4.4 Estimation Using Simulation

When the board temperature is not known, a thermal simulation of the application is needed. The simple two-resistor model can be used with the thermal simulation of the application, or a more accurate and complex model of the package can be used in the thermal simulation.

4.5 Experimental Determination

To determine the junction temperature of the device in the application after prototypes are available, the thermal characterization parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

Ψ_{JT} = thermal characterization parameter

T_T = thermocouple temperature on top of package

P_D = power dissipation in package

The thermal characterization parameter is measured per JEDEC JESD51-2 specification using a 40-gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the case to avoid measurement errors caused by cooling effects of the thermocouple wire.

4.6 Layout Practices

Each VDD and VDDH pin should be provided with a low-impedance path to the board's power supplies. Each ground pin should likewise be provided with a low-impedance path to ground. The power supply pins drive distinct groups of logic on chip. The VDD and VDDH power supplies should be bypassed to ground using bypass capacitors located as close as possible to the four sides of the package. For filtering high frequency noise, a capacitor of 0.1uF on each VDD and VDDH pin is recommended. Further, for medium frequency noise, a total of 2 capacitors of 47uF for VDD and 2 capacitors of 47uF for VDDH are also recommended. The capacitor leads and associated printed circuit traces connecting to chip VDD, VDDH and ground should be kept to less than half an inch per capacitor lead. Boards should employ separate inner layers for power and GND planes.

All output pins on the SoC have fast rise and fall times. Printed circuit (PC) trace interconnection length should be minimized to minimize overdamped conditions and reflections caused by these fast output switching times. This recommendation particularly applies to the address and data buses. Maximum PC trace lengths of six inches are recommended. Capacitance calculations should consider all device loads as well as parasitic capacitances due to the PC traces. Attention to proper PCB layout and bypassing becomes especially critical in systems with higher capacitive loads because these loads create higher transient currents in the VDD and GND circuits. Pull up all unused inputs or signals that will be inputs during reset. Special care should be taken to minimize the noise levels on the PLL supply pins.

6 AC Electrical Characteristics

The following sections include illustrations and tables of clock diagrams, signals, and CPM outputs and inputs for 66.67/83.33/100/133 MHz devices. Note that AC timings are based on a 50-pf load for MAX Delay and 10-pf load for MIN delay. Typical output buffer impedances are shown in this table.

Table 9. Output Buffer Impedances[1]

Output Buffers	Typical Impedance (Ω)
60x bus	45 or 27[2]
Memory controller	45 or 27[2]
Parallel I/O	45
PCI	27

1 These are typical values at 65° C. Impedance may vary by ±25% with process and temperature.
2 Impedance value is selected through SIUMCR[20,21]. See the SoC reference manual.

1 Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.

NOTE

Activating data pipelining (setting BR*x*[DR] in the memory controller) improves the AC timing.

This figure shows the interaction of several bus signals.

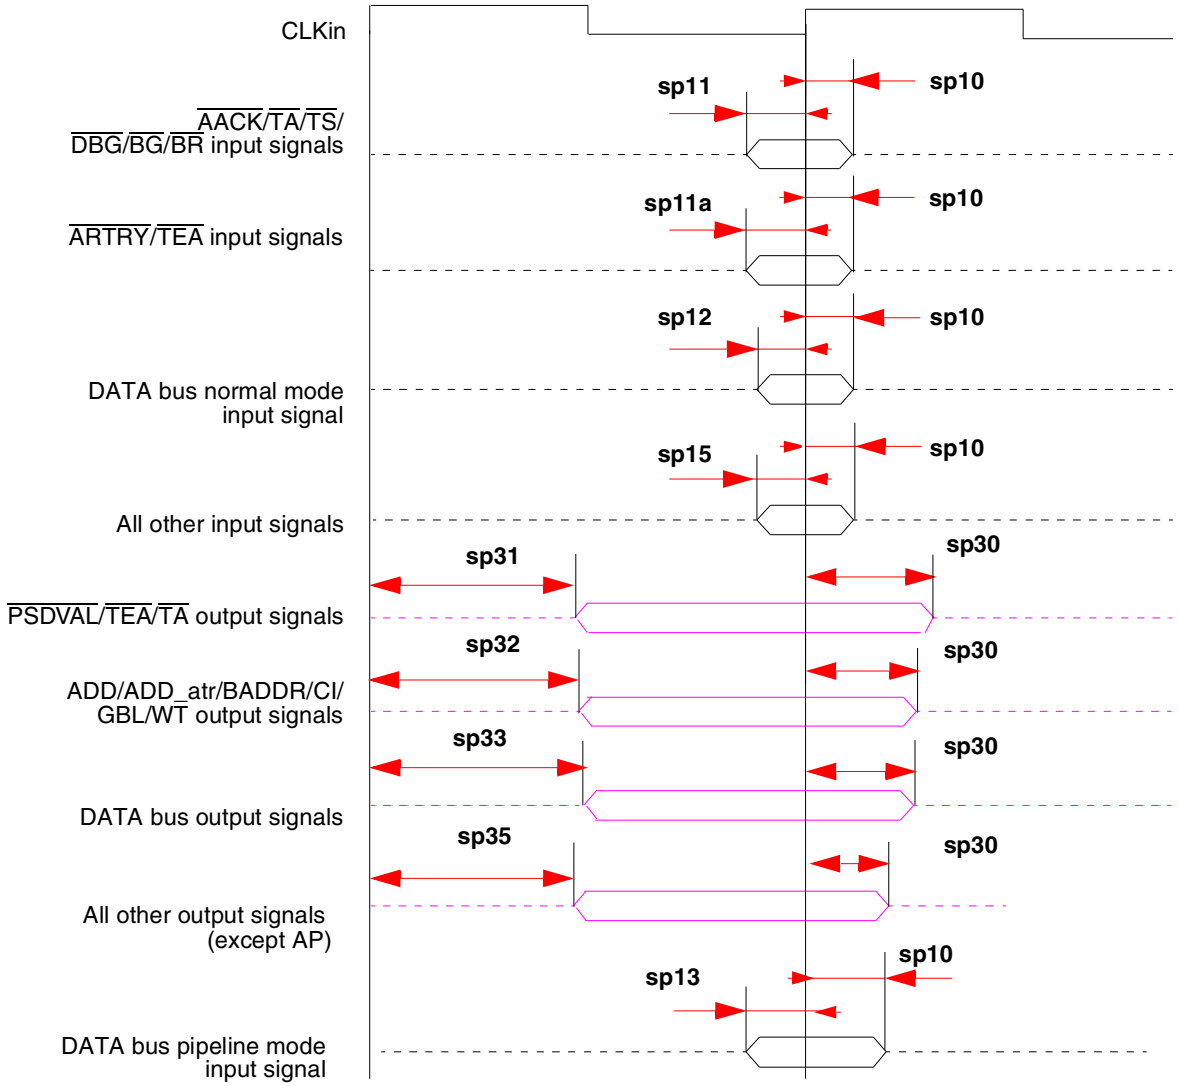

Figure 9. Bus Signals

This figure shows signal behavior in MEMC mode.

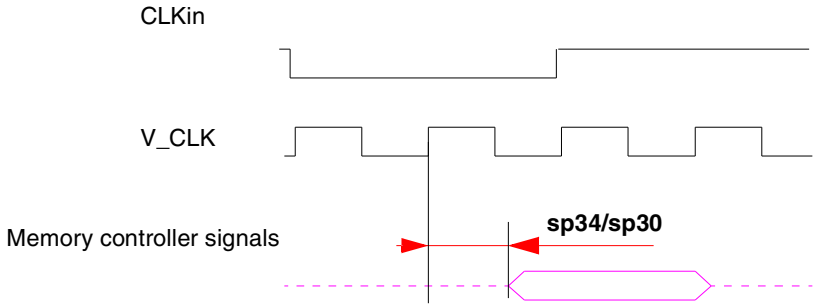

Figure 10. MEMC Mode Diagram

NOTE

Generally, all SoC bus and system output signals are driven from the rising edge of the input clock (CLKin). Memory controller signals, however, trigger on four points within a CLKin cycle. Each cycle is divided by four internal ticks: T1, T2, T3, and T4. T1 always occurs at the rising edge, and T3 at the falling edge, of CLKin. However, the spacing of T2 and T4 depends on the PLL clock ratio selected, as shown in Table 14.

Table 14. Tick Spacing for Memory Controller Signals

PLL Clock Ratio	Tick Spacing (T1 Occurs at the Rising Edge of CLKin)		
	T2	T3	T4
1:2, 1:3, 1:4, 1:5, 1:6	1/4 CLKin	1/2 CLKin	3/4 CLKin
1:2.5	3/10 CLKin	1/2 CLKin	8/10 CLKin
1:3.5	4/14 CLKin	1/2 CLKin	11/14 CLKin

This table is a representation of the information in Table 14.

1 The “low” values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The “high” values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user’s device. The minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. The minimum CPM frequency is 120 MHz.

2 PCI_MODCK determines the PCI clock frequency range. SeeTable 18 for lower range configurations.

3 MODCK_H = hard reset configuration word [28–31] (see Section 5.4 in the SoC reference manual). MODCK[1-3] = three hardware configuration pins.

4 CPM multiplication factor = CPM clock/bus clock

5 CPU multiplication factor = Core PLL multiplication factor

6 CPM_CLK/PCI_CLK ratio. When PCI_MODCK = 0, the ratio of CPM_CLK/PCI_CLK should be calculated from SCCR[PCIDF] as follows:
CPM_CLK/PCI_CLK = (PCIDF + 1) / 2.

1 Must be tied to ground.

2 Should be tied to VDDH via a 2K Ω external pull-up resistor.

3 The default configuration of the CPM pins (PA[8–31], PB[18–31], PC[0–1,4–29], PD[7–25, 29–31]) is input. To prevent excessive DC current, it is recommended either to pull unused pins to GND or VDDH, or to configure them as outputs.

4 This pin is not connected. It should be left floating.

5 Must be pulled down or left floating

Table 23. Document Revision History (continued)

Revision	Date	Substantive Changes
1.2	09/2005	• Added 133-MHz to the list of frequencies in the opening sentence of Section 6, "AC Electrical Characteristics". • Added 133 MHz columns to Table 9, Table 11, Table 12, and Table 13. • Added footnote 2 to Table 13. • Added the conditions note directly above Table 12.
1.1	01/2005	• Modification for correct display of assertion level ("overbar") for some signals
1.0	12/2004	• Section 1.1: Added 8:1 ratio to Internal CPM/bus clock multiplier values • Section 2: removed voltage tracking note • Table 3: Note 2 updated regarding VDD/VCCSYN relationship to VDDH during power-on reset • Table 4: Updated VDD and VCCSYN to 1.425 V - 1.575 V • Table 8: Note 2 updated to reflect VIH=2.5 for TCK, TRST, PORESET; request for external pull-up removed. • Section 4.6: Updated description of layout practices • Table 8: Note 3 added regarding IIC compatibility • Table 8: Updated nominal and maximum power dissipation values • Table 9: updated PCI impedance to 27Ω, updated 60x and MEMC values and added note to reflect configurable impedance • Section 6: Added sentence providing derating factor • Section 6.1: added Note: Rise/Fall Time on CPM Input Pins • Table 9: updated values for following specs: sp36b, sp37a, sp38a, sp39a, sp38b, sp40, sp41, sp42, sp43, sp42a • Table 11: updated values for following specs: sp16a, sp16b, sp18a, sp18b, sp20, sp21, sp22 • Section 6.2: added spread spectrum clocking note • Section 6.2: added CLKIN jitter note • Table 12: combined specs sp11 and sp11a • Table 13: sp30 Data Bus minimum delay values changed to 0.8 • Section 7: unit of ns added to Tval notes • Section 7: Updated all notes to reflect updated CPU Fmin of 150 MHz commercial temp devices, 175 MHz extended temp; CPM Fmin of 120 MHz. • Section 7, "Clock Configuration Modes": Updated all table footnotes reflect updated CPU Fmin of 150 MHz commercial temp devices, 175 MHz extended temp; CPM Fmin of 120 MHz. • Table 21: correct superscript of footnote number after pin AD22 • Table 21: remove DONE3 from PC12 • Table 21: signals referring to TDMs C2 and D2 removed
