Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC G2_LE
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	400MHz
Co-Processors/DSP	Communications; RISC CPM, Security; SEC
RAM Controllers	DRAM, SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100Mbps (2)
SATA	-
USB	USB 2.0 (1)
Voltage - I/O	3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	Cryptography, Random Number Generator
Package / Case	516-BBGA
Supplier Device Package	516-PBGA (27x27)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/kmpc8272vrtiea

1 Overview

This table shows the functionality supported by each SoC in the MPC8272 family.

Table 1. MPC8272 PowerQUICC II Family Functionality

Functionality	SoCs			
	MPC8272	MPC8248	MPC8271	MPC8247
Package[1]	516 PBGA			
Serial communications controllers (SCCs)	3	3	3	3
QUICC multi-channel controller (QMC)	Yes	Yes	Yes	Yes
Fast communication controllers (FCCs)	2	2	2	2
I-Cache (Kbyte)	16	16	16	16
D-Cache (Kbyte)	16	16	16	16
Ethernet (10/100)	2	2	2	2
UTOPIA II Ports	1	0	1	0
Multi-channel controllers (MCCs)	0	0	0	0
PCI bridge	Yes	Yes	Yes	Yes
Transmission convergence (TC) layer	—	—	—	—
Inverse multiplexing for ATM (IMA)	—	—	—	—
Universal serial bus (USB) 2.0 full/low rate	1	1	1	1
Security engine (SEC)	Yes	Yes	—	—

[1] See Table 2.

Devices in the MPC8272 family are available in two packages—the VR or ZQ package—as shown in . For package ordering information, see Section 10, “Ordering Information.”

Table 2. MPC8272 PowerQUICC II Device Packages

Code (Package)	VR (516 PBGA—Lead free)	ZQ (516 PBGA—Lead spheres)
Device	MPC8272VR	MPC8272ZQ
	MPC8248VR	MPC8248ZQ
	MPC8271VR	MPC8271ZQ
	MPC8247VR	MPC8247ZQ

- Integrated security engine (SEC) (MPC8272 and MPC8248 only)
  - Supports DES, 3DES, MD-5, SHA-1, AES, PKEU, RNG and RC-4 encryption algorithms in hardware
- Communications processor module (CPM)
  - Embedded 32-bit communications processor (CP) uses a RISC architecture for flexible support for communications peripherals
  - Interfaces to G2_LE core through on-chip dual-port RAM and DMA controller. (Dual-port RAM size is 16 KB plus 4 KB dedicated instruction RAM.)
  - Microcode tracing capabilities
  - Eight CPM trap registers
- Universal serial bus (USB) controller
  - Supports USB 2.0 full/low rate compatible
  - USB host mode
    - Supports control, bulk, interrupt, and isochronous data transfers
    - CRC16 generation and checking
    - NRZI encoding/decoding with bit stuffing
    - Supports both 12- and 1.5-Mbps data rates (automatic generation of preamble token and data rate configuration). Note that low-speed operation requires an external hub.
    - Flexible data buffers with multiple buffers per frame
    - Supports local loopback mode for diagnostics (12 Mbps only)
  - Supports USB slave mode
    - Four independent endpoints support control, bulk, interrupt, and isochronous data transfers
    - CRC16 generation and checking
    - CRC5 checking
    - NRZI encoding/decoding with bit stuffing
    - 12- or 1.5-Mbps data rate
    - Flexible data buffers with multiple buffers per frame
    - Automatic retransmission upon transmit error
  - Serial DMA channels for receive and transmit on all serial channels
  - Parallel I/O registers with open-drain and interrupt capability
  - Virtual DMA functionality executing memory-to-memory and memory-to-I/O transfers
  - Two fast communication controllers (FCCs) supporting the following protocols:
    - 10-/100-Mbit Ethernet/IEEE 802.3 CDMA/CS interface through media independent interface (MII)
    - Transparent
    - HDLC—up to T3 rates (clear channel)

  - One of the FCCs supports ATM (MPC8272 and MPC8271 only)—full-duplex SAR at 155 Mbps, 8-bit UTOPIA interface 31 Mphys, AAL5, AAL1, AAL2, AAL0 protocols, TM 4.0 CBR, VBR, UBR, ABR traffic types, up to 64-K external connections

— Three serial communications controllers (SCCs) identical to those on the MPC860 supporting the digital portions of the following protocols:
  - Ethernet/IEEE 802.3 CDMA/CS
  - HDLC/SDLC and HDLC bus
  - Universal asynchronous receiver transmitter (UART)
  - Synchronous UART
  - Binary synchronous (BiSync) communications
  - Transparent
  - QUICC multichannel controller (QMC) up to 64 channels
    - Independent transmit and receive routing, frame synchronization.
    - Serial-multiplexed (full-duplex) input/output 2048, 1544, and 1536 Kbps PCM highways
    - Compatible with T1/DS1 24-channel and CEPT E1 32-channel PCM highway, ISDN basic rate, ISDN primary rate, and user defined.
    - Subchanneling on each time slot.
    - Independent transmit and receive routing, frame synchronization and clocking
    - Concatenation of any not necessarily consecutive time slots to channels independently for receiver/transmitter
    - Supports H1,H11, and H12 channels
    - Allows dynamic allocation of channels
  - SCC3 in NMSI mode is not usable when USB is enabled.
— Two serial management controllers (SMCs), identical to those of the MPC860
  - Provides management for BRI devices as general-circuit interface (GCI) controllers in time-division-multiplexed (TDM) channels
  - Transparent
  - UART (low-speed operation)
— One serial peripheral interface identical to the MPC860 SPI
— One I^2C controller (identical to the MPC860 I^2C controller)
  - Microwire compatible
  - Multiple-master, single-master, and slave modes
— Up to two TDM interfaces
  - Supports one groups of two TDM channels
  - 1024 bytes of SI RAM
— Eight independent baud rate generators and 14 input clock pins for supplying clocks to FCC, SCC, SMC, and USB serial channels
— Four independent 16-bit timers that can be interconnected as two 32-bit timers

Table 6.

1 TCK, TRST and PORESET have min VIH = 2.5V.

2 The leakage current is measured for nominal VDDH,VCCSYN, and VDD.

3 V_{IL} for IIC interface does not match IIC standard, but does meet IIC standard for V_{OL} and should not cause any compatibility issue.

4.2 Estimation with Junction-to-Case Thermal Resistance

Historically, the thermal resistance has frequently been expressed as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

$R_{\theta JA}$ = junction-to-ambient thermal resistance (ºC/W)

$R_{\theta JC}$ = junction-to-case thermal resistance (ºC/W)

$R_{\theta CA}$ = case-to-ambient thermal resistance (ºC/W)

$R_{\theta JC}$ is device related and cannot be influenced by the user. The user adjusts the thermal environment to affect the case-to-ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the air flow around the device, add a heat sink, change the mounting arrangement on the printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device. This thermal model is most useful for ceramic packages with heat sinks where some 90% of the heat flows through the case and the heat sink to the ambient environment. For most packages, a better model is required.

4.3 Estimation with Junction-to-Board Thermal Resistance

A simple package thermal model which has demonstrated reasonable accuracy (about 20%) is a two-resistor model consisting of a junction-to-board and a junction-to-case thermal resistance. The junction-to-case thermal resistance covers the situation where a heat sink is used or where a substantial amount of heat is dissipated from the top of the package. The junction-to-board thermal resistance describes the thermal performance when most of the heat is conducted to the printed circuit board. It has been observed that the thermal performance of most plastic packages, especially PBGA packages, is strongly dependent on the board temperature.

If the board temperature is known, an estimate of the junction temperature in the environment can be made using the following equation:

$$T_J = T_B + (R_{\theta JB} \times P_D)$$

where:

$R_{\theta JB}$ = junction-to-board thermal resistance (ºC/W)

T_B = board temperature (ºC)

P_D = power dissipation in package

If the board temperature is known and the heat loss from the package case to the air can be ignored, acceptable predictions of junction temperature can be made. For this method to work, the board and board mounting must be similar to the test board used to determine the junction-to-board thermal resistance, namely a 2s2p (board with a power and a ground plane) and by attaching the thermal balls to the ground plane.

4.4 Estimation Using Simulation

When the board temperature is not known, a thermal simulation of the application is needed. The simple two-resistor model can be used with the thermal simulation of the application, or a more accurate and complex model of the package can be used in the thermal simulation.

4.5 Experimental Determination

To determine the junction temperature of the device in the application after prototypes are available, the thermal characterization parameter (Ψ_{JT}) can be used to determine the junction temperature with a measurement of the temperature at the top center of the package case using the following equation:

$$T_J = T_T + (\Psi_{JT} \times P_D)$$

where:

Ψ_{JT} = thermal characterization parameter

T_T = thermocouple temperature on top of package

P_D = power dissipation in package

The thermal characterization parameter is measured per JEDEC JESD51-2 specification using a 40-gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over 1 mm of wire extending from the junction. The thermocouple wire is placed flat against the case to avoid measurement errors caused by cooling effects of the thermocouple wire.

4.6 Layout Practices

Each VDD and VDDH pin should be provided with a low-impedance path to the board's power supplies. Each ground pin should likewise be provided with a low-impedance path to ground. The power supply pins drive distinct groups of logic on chip. The VDD and VDDH power supplies should be bypassed to ground using bypass capacitors located as close as possible to the four sides of the package. For filtering high frequency noise, a capacitor of 0.1uF on each VDD and VDDH pin is recommended. Further, for medium frequency noise, a total of 2 capacitors of 47uF for VDD and 2 capacitors of 47uF for VDDH are also recommended. The capacitor leads and associated printed circuit traces connecting to chip VDD, VDDH and ground should be kept to less than half an inch per capacitor lead. Boards should employ separate inner layers for power and GND planes.

All output pins on the SoC have fast rise and fall times. Printed circuit (PC) trace interconnection length should be minimized to minimize overdamped conditions and reflections caused by these fast output switching times. This recommendation particularly applies to the address and data buses. Maximum PC trace lengths of six inches are recommended. Capacitance calculations should consider all device loads as well as parasitic capacitances due to the PC traces. Attention to proper PCB layout and bypassing becomes especially critical in systems with higher capacitive loads because these loads create higher transient currents in the VDD and GND circuits. Pull up all unused inputs or signals that will be inputs during reset. Special care should be taken to minimize the noise levels on the PLL supply pins.

6 AC Electrical Characteristics

The following sections include illustrations and tables of clock diagrams, signals, and CPM outputs and inputs for 66.67/83.33/100/133 MHz devices. Note that AC timings are based on a 50-pf load for MAX Delay and 10-pf load for MIN delay. Typical output buffer impedances are shown in this table.

Table 9. Output Buffer Impedances[1]

Output Buffers	Typical Impedance (Ω)
60x bus	45 or 27[2]
Memory controller	45 or 27[2]
Parallel I/O	45
PCI	27

1 These are typical values at 65° C. Impedance may vary by ±25% with process and temperature.
2 Impedance value is selected through SIUMCR[20,21]. See the SoC reference manual.

6.1 CPM AC Characteristics

This table lists CPM output characteristics.

Table 10. AC Characteristics for CPM Outputs[1]

Spec Number		Characteristic	Value (ns)							
			Maximum Delay				Minimum Delay			
Max	Min		66 MHz	83 MHz	100 MHz	133 MHz	66 MHz	83 MHz	100 MHz	133 MHz
sp36a	sp37a	FCC outputs—internal clock (NMSI)	6	5.5	5.5	5.5	0.5	0.5	0.5	0.5
sp36b	sp37b	FCC outputs—external clock (NMSI)	8	8	8	8	2	2	2	2
sp38a	sp39a	SCC/SMC/SPI/I2C outputs—internal clock (NMSI)	10	10	10	10	0	0	0	0
sp38b	sp39b	SCC/SMC/SPI/I2C outputs—external clock (NMSI)	8	8	8	8	2	2	2	2
sp40	sp41	TDM outputs/SI	11	11	11	11	2.5	2.5	2.5	2.5
sp42	sp43	TIMER/IDMA outputs	11	11	11	11	0.5	0.5	0.5	0.5
sp42a	sp43a	PIO outputs	11	11	11	11	0.5	0.5	0.5	0.5

1 Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.

This table lists CPM input characteristics.

NOTE: Rise/Fall Time on CPM Input Pins

It is recommended that the rise/fall time on CPM input pins should not exceed 5 ns. This should be enforced especially on clock signals. Rise time refers to signal transitions from 10% to 90% of VCC; fall time refers to transitions from 90% to 10% of VCC.

Table 11. AC Characteristics for CPM Inputs[1]

Spec Number		Characteristic	Value (ns)							
			Setup				Hold			
Setup	Hold		66 MHz	83 MHz	100 MHz	133 MHz	66 MHz	83 MHz	100 MHz	133 MHz
sp16a	sp17a	FCC inputs—internal clock (NMSI)	6	6	6	6	0	0	0	0
sp16b	sp17b	FCC inputs—external clock (NMSI)	2.5	2.5	2.5	2.5	2	2	2	2
sp18a	sp19a	SCC/SMC/SPI/I2C inputs—internal clock (NMSI)	6	6	6	6	0	0	0	0
sp18b	sp19b	SCC/SMC/SPI/I2C inputs—external clock (NMSI)	4	4	4	4	2	2	2	2
sp20	sp21	TDM inputs/SI	3	3	3	3	2.5	2.5	2.5	2.5
sp22	sp23	PIO/TIMER/IDMA inputs	8	8	8	8	0.5	0.5	0.5	0.5

1 Input specifications are measured from the 50% level of the signal to the 50% level of the rising edge of CLKIN. Timings are measured at the pin.

NOTE

Although the specifications generally reference the rising edge of the clock, the following AC timing diagrams also apply when the falling edge is the active edge.

This figure shows the FCC internal clock.

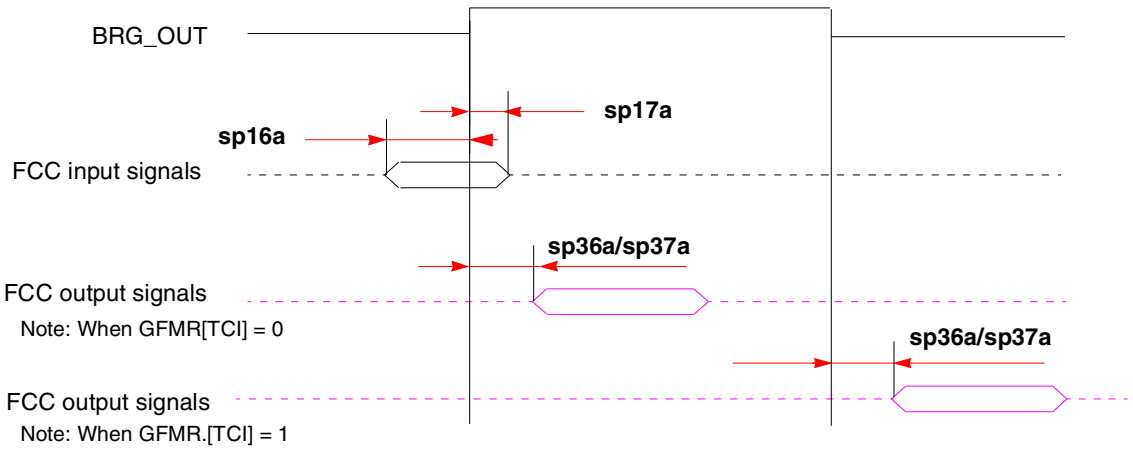

Figure 3. FCC Internal Clock Diagram

This figure shows the FCC external clock.

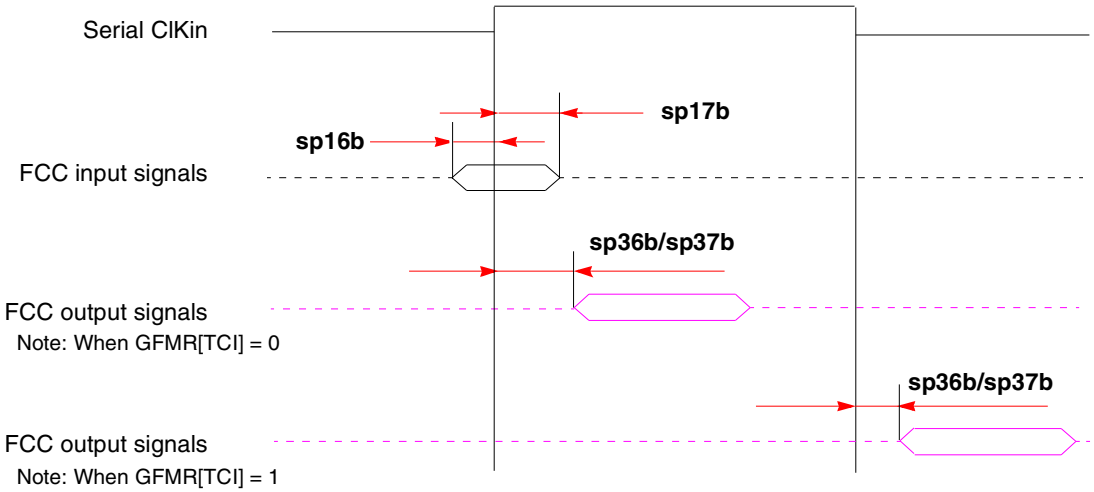

Figure 4. FCC External Clock Diagram

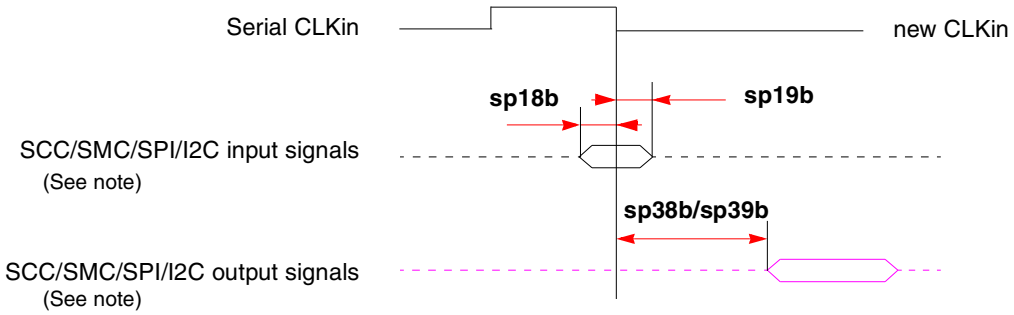
This figure shows the SCC/SMC/SPI/I^2C external clock.



Note: There are four possible timing conditions for SPI:
1. Input sampled on the rising edge and output driven on the rising edge.
2. Input sampled on the rising edge and output driven on the falling edge.
3. Input sampled on the falling edge and output driven on the falling edge (shown).
4. Input sampled on the falling edge and output driven on the rising edge.

Note: There are two possible timing conditions for SCC/SMC/I^2C:
1. Input sampled on the falling edge and output driven on the falling edge (shown).
2. Input sampled on the falling edge and output driven on the rising edge.

Figure 5. SCC/SMC/SPI/I^2C External Clock Diagram

NOTE

Activating data pipelining (setting BR*x*[DR] in the memory controller) improves the AC timing.

This figure shows the interaction of several bus signals.

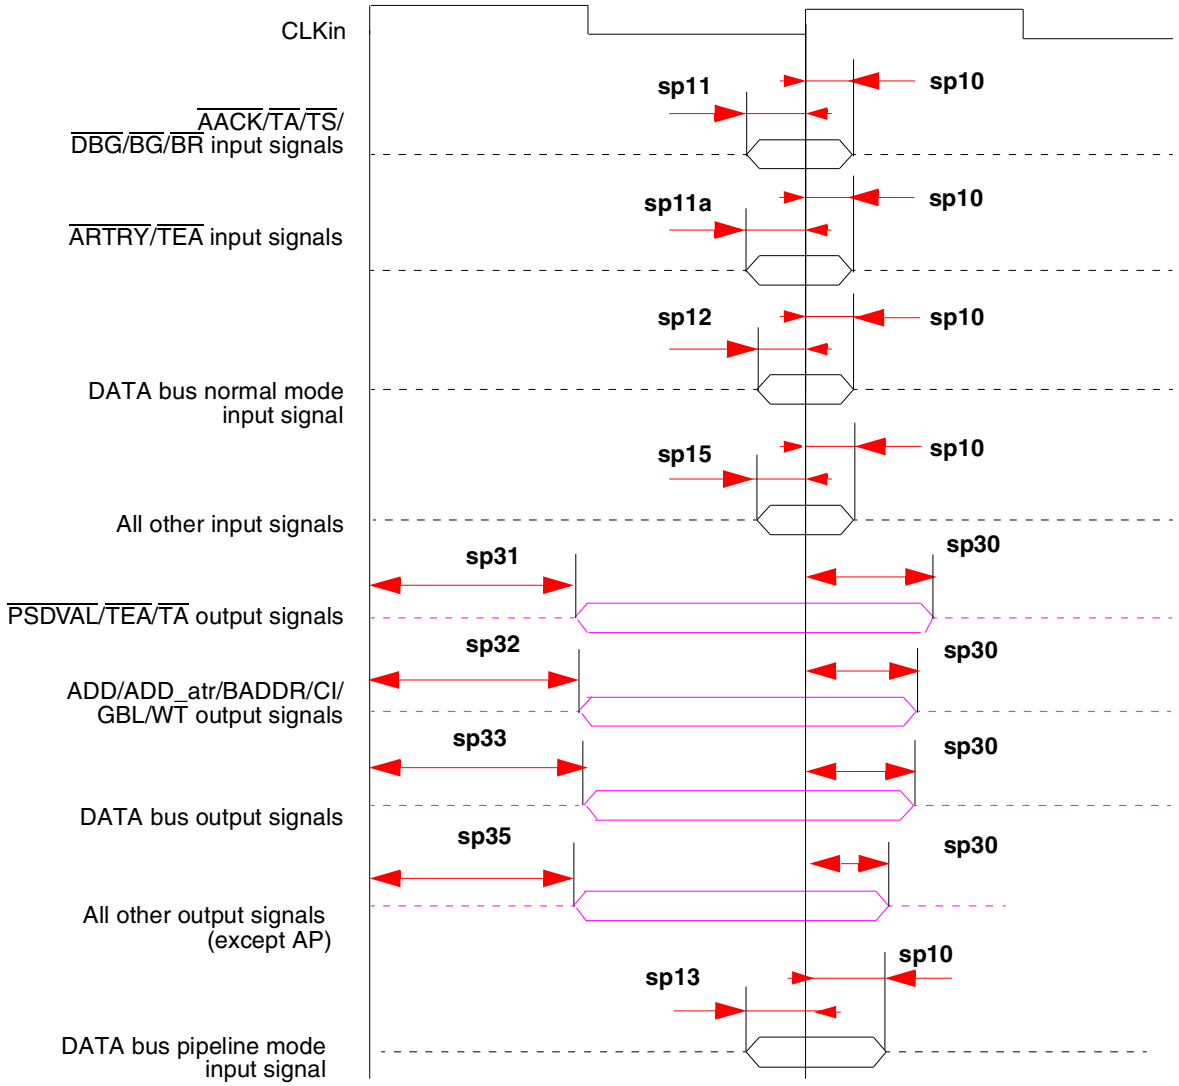


Figure 9. Bus Signals

This figure shows signal behavior in MEMC mode.

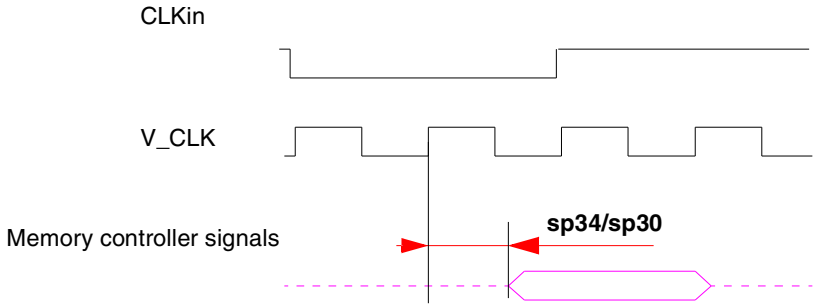

Figure 10. MEMC Mode Diagram

NOTE

Generally, all SoC bus and system output signals are driven from the rising edge of the input clock (CLKin). Memory controller signals, however, trigger on four points within a CLKin cycle. Each cycle is divided by four internal ticks: T1, T2, T3, and T4. T1 always occurs at the rising edge, and T3 at the falling edge, of CLKin. However, the spacing of T2 and T4 depends on the PLL clock ratio selected, as shown in Table 14.

Table 14. Tick Spacing for Memory Controller Signals

PLL Clock Ratio	Tick Spacing (T1 Occurs at the Rising Edge of CLKin)		
	T2	T3	T4
1:2, 1:3, 1:4, 1:5, 1:6	1/4 CLKin	1/2 CLKin	3/4 CLKin
1:2.5	3/10 CLKin	1/2 CLKin	8/10 CLKin
1:3.5	4/14 CLKin	1/2 CLKin	11/14 CLKin

This table is a representation of the information in Table 14.

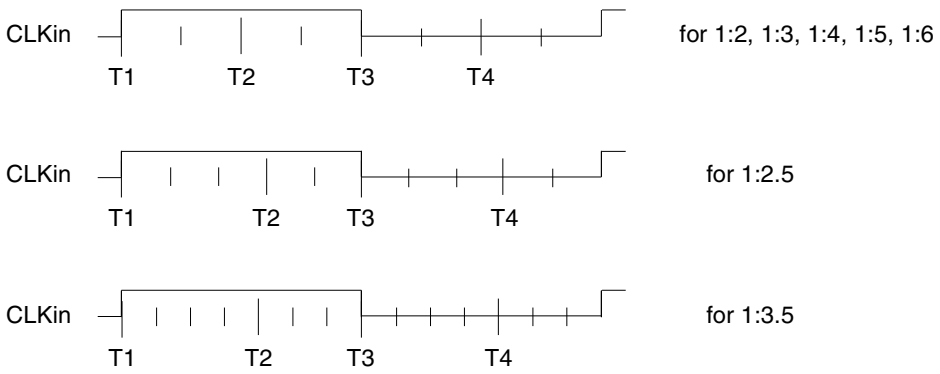

Figure 11. Internal Tick Spacing for Memory Controller Signals

Table 18. Clock Configurations for PCI Host Mode (PCI_MODCK=1)[1,2] (continued)

Mode[3]	Bus Clock (MHz)		CPM Multiplication Factor[4]	CPM Clock (MHz)		CPU Multiplication Factor[5]	CPU Clock (MHz)		PCI Division Factor[6]	PCI Clock (MHz)

9 Package Description

This figure shows the side profile of the PBGA package to indicate the direction of the top surface view.

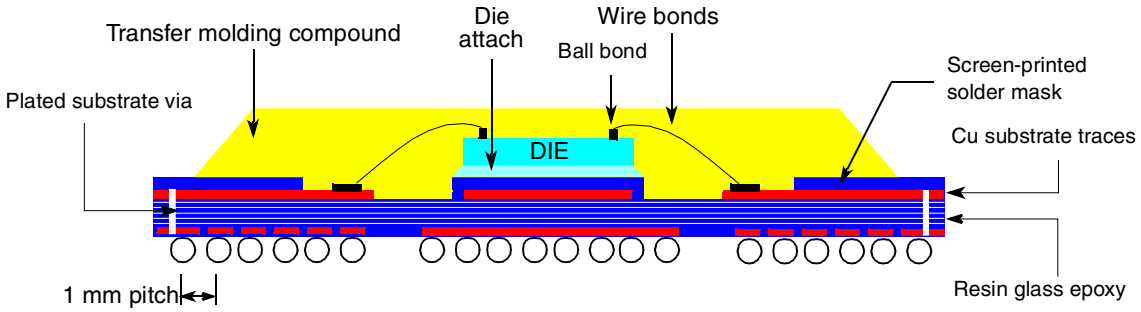

Figure 13. Side View of the PBGA Package Remove

9.1 Package Parameters

This table provides package parameters.

Table 22. Package Parameters

Code	Type	Outline (mm)	Interconnects	Pitch (mm)	Nominal Unmounted Height (mm)
VR, ZQ	PBGA	27 x 27	516	1	2.25

NOTE: Temperature Reflow for the VR Package

In the VR package, sphere composition is lead-free (see Table 2). This requires higher temperature reflow than what is required for other PowerQUICC II packages. Consult “Freescale PowerQUICC II Pb-Free Packaging Information” (MPC8250PBFREEPKG) available on www.freescale.com.

9.2 Mechanical Dimensions

This figure provides the mechanical dimensions and bottom surface nomenclature of the 516 PBGA package.

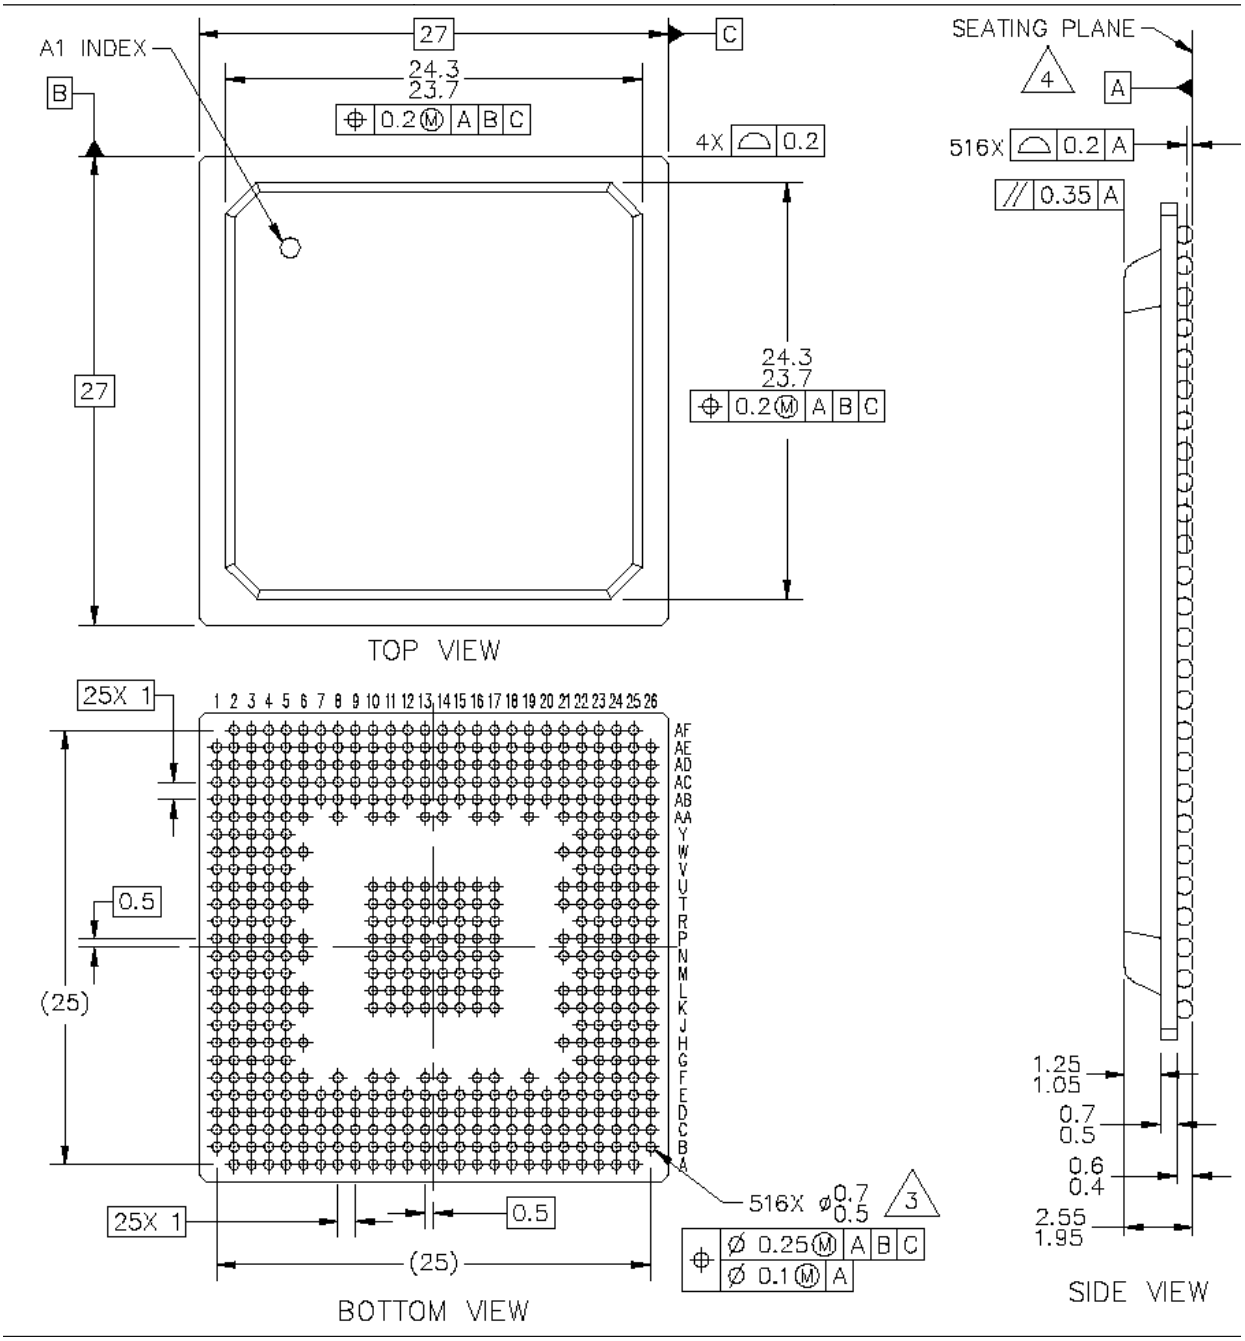

Figure 14. Mechanical Dimensions and Bottom Surface Nomenclature—516 PBGA

Table 23. Document Revision History (continued)

Revision	Date	Substantive Changes
0.2	12/2003	• Table 1: New • Table 2: New • Table 4: Modification of VDD and VCCSYN to 1.45–1.60 V • Table 8: Addition of note 2 regarding TRST and PORESET (see V_{IH} row of Table 8) • Table 8 and Table 21: Addition of muxed signals CPCI_HS_ES to PCI_REQ1 (AF14) CPCI_HS_LED to PCI_GNT1 (AE13) CPCI_HS_ENUM to PCI_GNT2 (AF21) • Table 8 and Table 21: Modification of PCI signal names for consistency with PCI signal names on other PowerQUICC II devices: PCI_CFG0 (PCI_HOST_EN) (AC21) PCI_CFG1 (PCI_ARB_EN) (AE22) PCI_CFG2 (DLL_ENABLE) (AE23) PCI_PAR (AF12) PCI_FRAME (AD15) PCI_TRDY(AF16) PCI_IRDY (AF15) PCI_STOP (AE15) DEVSEL (AE14) PCI_IDSEL (AC17) PCI_PERR (AD14) PCI_SERR (AD13) PCI_REQ0–2 (AAE20, AF14, AB14) PCI_GNT0–2 (AD20, AE13, AF21) PCI_RST (AF22) PCI_INTA (AE21) PCI_C0-3 (AE12, AF13, AC15, AE18) PCI_AD0-31 • Table 8 and Table 21: Corrected assertion level (added "‾") PCI_HOST_EN (AC21) and PCI_ARB_EN (AE22) • Table 7: Addition of $R_{\theta JT}$ and note 4 • Sections 4.1–4.5 and 4.7 on thermal characteristics: New • Section 7, "Clock Configuration Modes": Modification to first paragraph. Note that PCI_MODCK is a bit in the Hard Reset Configuration Word. It is not an input signal as it is in the MPC8280 Family and MPC8260 Family. • Addition of "Note: Temperature Reflow for the VR Package" on page 56 • Table 21: Addition of note 2 to TRST (E21) and PORESET (C24) • Table 21: Removal of Thermal0 (D19) and Thermal1(J3). These pins are now "No connects." Note 4 unchanged. • Table 21: Removal of Spare0 (AD24). This pin is now a "No connect." Note 5 unchanged. • Table 21: Addition of PCI_MODE (AD22). This pin was previously listed as "Ground." Addition of note 1.
0.1	9/2003	• Addition of the MPC8271 and the MPC8247 (these devices do not have a security engine) • Table 8: Addition of note 2 to V_{IH} • Table 8: Changed I_{OL} for 60x signals to 6.0 mA • Modification of note 1 for Table 17, Table 18, Table 19, and Table 20 • Table 21: Addition of ball AD9 to GND. In rev 0 of this document, AD8 was listed as assigned to both CS5 and GND. AD8 is only assigned to CS5. • Table 21: Addition of note 4 to Thermal0 (D19) and Thermal1(J3) • Addition of ZQ package code to Figure 15
