

Welcome to E-XFL.COM

Understanding [Embedded - Microprocessors](#)

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of [Embedded - Microprocessors](#)

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details

Product Status	Active
Core Processor	PowerPC G2_LE
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	400MHz
Co-Processors/DSP	Communications; RISC CPM
RAM Controllers	DRAM, SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100Mbps (2)
SATA	-
USB	USB 2.0 (1)
Voltage - I/O	3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	-
Package / Case	516-BBGA
Supplier Device Package	516-PBGA (27x27)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=mpc8247vrtmfa

1 Overview

This table shows the functionality supported by each SoC in the MPC8272 family.

Table 1. MPC8272 PowerQUICC II Family Functionality

Functionality	Package ¹	SoCs			
		MPC8272	MPC8248	MPC8271	MPC8247
		516 PBGA			
Serial communications controllers (SCCs)		3	3	3	3
QUICC multi-channel controller (QMC)		Yes	Yes	Yes	Yes
Fast communication controllers (FCCs)		2	2	2	2
I-Cache (Kbyte)		16	16	16	16
D-Cache (Kbyte)		16	16	16	16
Ethernet (10/100)		2	2	2	2
UTOPIA II Ports		1	0	1	0
Multi-channel controllers (MCCs)		0	0	0	0
PCI bridge		Yes	Yes	Yes	Yes
Transmission convergence (TC) layer		—	—	—	—
Inverse multiplexing for ATM (IMA)		—	—	—	—
Universal serial bus (USB) 2.0 full/low rate		1	1	1	1
Security engine (SEC)		Yes	Yes	—	—

¹ See [Table 2](#).

Devices in the MPC8272 family are available in two packages—the VR or ZQ package—as shown in . For package ordering information, see [Section 10, “Ordering Information.”](#)

Table 2. MPC8272 PowerQUICC II Device Packages

Code (Package)	VR (516 PBGA—Lead free)	ZQ (516 PBGA—Lead spheres)
Device	MPC8272VR	MPC8272ZQ
	MPC8248VR	MPC8248ZQ
	MPC8271VR	MPC8271ZQ
	MPC8247VR	MPC8247ZQ

- Integrated security engine (SEC) (MPC8272 and MPC8248 only)
 - Supports DES, 3DES, MD-5, SHA-1, AES, PKEU, RNG and RC-4 encryption algorithms in hardware
- Communications processor module (CPM)
 - Embedded 32-bit communications processor (CP) uses a RISC architecture for flexible support for communications peripherals
 - Interfaces to G2_LE core through on-chip dual-port RAM and DMA controller. (Dual-port RAM size is 16 KB plus 4 KB dedicated instruction RAM.)
 - Microcode tracing capabilities
 - Eight CPM trap registers
- Universal serial bus (USB) controller
 - Supports USB 2.0 full/low rate compatible
 - USB host mode
 - Supports control, bulk, interrupt, and isochronous data transfers
 - CRC16 generation and checking
 - NRZI encoding/decoding with bit stuffing
 - Supports both 12- and 1.5-Mbps data rates (automatic generation of preamble token and data rate configuration). Note that low-speed operation requires an external hub.
 - Flexible data buffers with multiple buffers per frame
 - Supports local loopback mode for diagnostics (12 Mbps only)
 - Supports USB slave mode
 - Four independent endpoints support control, bulk, interrupt, and isochronous data transfers
 - CRC16 generation and checking
 - CRC5 checking
 - NRZI encoding/decoding with bit stuffing
 - 12- or 1.5-Mbps data rate
 - Flexible data buffers with multiple buffers per frame
 - Automatic retransmission upon transmit error
 - Serial DMA channels for receive and transmit on all serial channels
 - Parallel I/O registers with open-drain and interrupt capability
 - Virtual DMA functionality executing memory-to-memory and memory-to-I/O transfers
 - Two fast communication controllers (FCCs) supporting the following protocols:
 - 10-/100-Mbit Ethernet/IEEE 802.3 CDMA/CS interface through media independent interface (MII)
 - Transparent
 - HDLC—up to T3 rates (clear channel)

3 DC Electrical Characteristics

This table shows DC electrical characteristics.

Table 5. DC Electrical Characteristics¹

Characteristic	Symbol	Min	Max	Unit
Input high voltage—all inputs except TCK, $\overline{\text{TRST}}$ and $\overline{\text{PORESET}}$ ²	V_{IH}	2.0	3.465	V
Input low voltage ³	V_{IL}	GND	0.8	V
CLKIN input high voltage	V_{IHC}	2.4	3.465	V
CLKIN input low voltage	V_{ILC}	GND	0.4	V
Input leakage current, $V_{IN} = V_{DDH}$ ⁴	I_{IN}	—	10	μA
Hi-Z (off state) leakage current, $V_{IN} = V_{DDH}$ ²	I_{OZ}	—	10	μA
Signal low input current, $V_{IL} = 0.8 \text{ V}$	I_L	—	1	μA
Signal high input current, $V_{IH} = 2.0 \text{ V}$	I_H	—	1	μA
Output high voltage, $I_{OH} = -2 \text{ mA}$ except UTOPIA mode, and open drain pins In UTOPIA mode ⁵ (UTOPIA pins only): $I_{OH} = -8.0 \text{ mA}$ PA[8–31] PB[18–31] PC[0–1,4–29] PD[7–25, 29–31]	V_{OH}	2.4	—	V
In UTOPIA mode ⁵ (UTOPIA pins only): $I_{OL} = 8.0 \text{ mA}$ PA[8–31] PB[18–31] PC[0–1,4–29] PD[7–25, 29–31]	V_{OL}	—	0.5	V

4.2 Estimation with Junction-to-Case Thermal Resistance

Historically, the thermal resistance has frequently been expressed as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

$R_{\theta JA}$ = junction-to-ambient thermal resistance ($^{\circ}\text{C}/\text{W}$)

$R_{\theta JC}$ = junction-to-case thermal resistance ($^{\circ}\text{C}/\text{W}$)

$R_{\theta CA}$ = case-to-ambient thermal resistance ($^{\circ}\text{C}/\text{W}$)

$R_{\theta JC}$ is device related and cannot be influenced by the user. The user adjusts the thermal environment to affect the case-to-ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the air flow around the device, add a heat sink, change the mounting arrangement on the printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device. This thermal model is most useful for ceramic packages with heat sinks where some 90% of the heat flows through the case and the heat sink to the ambient environment. For most packages, a better model is required.

4.3 Estimation with Junction-to-Board Thermal Resistance

A simple package thermal model which has demonstrated reasonable accuracy (about 20%) is a two-resistor model consisting of a junction-to-board and a junction-to-case thermal resistance. The junction-to-case thermal resistance covers the situation where a heat sink is used or where a substantial amount of heat is dissipated from the top of the package. The junction-to-board thermal resistance describes the thermal performance when most of the heat is conducted to the printed circuit board. It has been observed that the thermal performance of most plastic packages, especially PBGA packages, is strongly dependent on the board temperature.

If the board temperature is known, an estimate of the junction temperature in the environment can be made using the following equation:

$$T_J = T_B + (R_{\theta JB} \times P_D)$$

where:

$R_{\theta JB}$ = junction-to-board thermal resistance ($^{\circ}\text{C}/\text{W}$)

T_B = board temperature ($^{\circ}\text{C}$)

P_D = power dissipation in package

If the board temperature is known and the heat loss from the package case to the air can be ignored, acceptable predictions of junction temperature can be made. For this method to work, the board and board mounting must be similar to the test board used to determine the junction-to-board thermal resistance, namely a 2s2p (board with a power and a ground plane) and by attaching the thermal balls to the ground plane.

This table lists CPM input characteristics.

NOTE: Rise/Fall Time on CPM Input Pins

It is recommended that the rise/fall time on CPM input pins should not exceed 5 ns. This should be enforced especially on clock signals. Rise time refers to signal transitions from 10% to 90% of VCC; fall time refers to transitions from 90% to 10% of VCC.

Table 11. AC Characteristics for CPM Inputs¹

Spec Number		Characteristic	Value (ns)							
Setup	Hold		Setup				Hold			
			66 MHz	83 MHz	100 MHz	133 MHz	66 MHz	83 MHz	100 MHz	133 MHz
sp16a	sp17a	FCC inputs—internal clock (NMSI)	6	6	6	6	0	0	0	0
sp16b	sp17b	FCC inputs—external clock (NMSI)	2.5	2.5	2.5	2.5	2	2	2	2
sp18a	sp19a	SCC/SMC/SPI/I2C inputs—internal clock (NMSI)	6	6	6	6	0	0	0	0
sp18b	sp19b	SCC/SMC/SPI/I2C inputs—external clock (NMSI)	4	4	4	4	2	2	2	2
sp20	sp21	TDM inputs/SI	3	3	3	3	2.5	2.5	2.5	2.5
sp22	sp23	PIO/TIMER/IDMA inputs	8	8	8	8	0.5	0.5	0.5	0.5

¹ Input specifications are measured from the 50% level of the signal to the 50% level of the rising edge of CLKIN. Timings are measured at the pin.

NOTE

Although the specifications generally reference the rising edge of the clock, the following AC timing diagrams also apply when the falling edge is the active edge.

This figure shows the FCC internal clock.

Figure 3. FCC Internal Clock Diagram

This figure shows the FCC external clock.

Figure 4. FCC External Clock Diagram

This figure shows the SCC/SMC/SPI/I²C external clock.

Note: There are four possible timing conditions for SPI:

1. Input sampled on the rising edge and output driven on the rising edge.
2. Input sampled on the rising edge and output driven on the falling edge.
3. Input sampled on the falling edge and output driven on the falling edge (shown).
4. Input sampled on the falling edge and output driven on the rising edge.

Note: There are two possible timing conditions for SCC/SMC/I²C:

1. Input sampled on the falling edge and output driven on the falling edge (shown).
2. Input sampled on the falling edge and output driven on the rising edge.

Figure 5. SCC/SMC/SPI/I²C External Clock Diagram

This figure shows PIO and timer signals.

Note: TGATE is asserted on the rising edge of the clock; it is deasserted on the falling edge.

Figure 8. PIO and Timer Signal Diagram

6.2 SIU AC Characteristics

This table lists SIU input characteristics.

NOTE: CLKIN Jitter and Duty Cycle

The CLKIN input to the SoC should not exceed ± 150 psec of jitter (peak-to-peak). This represents total input jitter—the combination of short term (peak-to-peak) and long term (cumulative). The duty cycle of CLKIN should not exceed the ratio of 40:60.

NOTE: Spread Spectrum Clocking

Spread spectrum clocking is allowed with 1% input frequency down-spread at maximum 60 KHz modulation rate regardless of input frequency.

NOTE: PCI AC Timing

The SoC meets the timing requirements of *PCI Specification Revision 2.2*. See [Section 7, “Clock Configuration Modes,”](#) and “Note: Tval (Output Hold)” to determine if a specific clock configuration is compliant.

NOTE

Activating data pipelining (setting BRx[DR] in the memory controller) improves the AC timing.

This figure shows the interaction of several bus signals.

Figure 9. Bus Signals

This figure shows signal behavior in MEMC mode.

Figure 10. MEMC Mode Diagram

NOTE

Generally, all SoC bus and system output signals are driven from the rising edge of the input clock (CLKIn). Memory controller signals, however, trigger on four points within a CLKIn cycle. Each cycle is divided by four internal ticks: T1, T2, T3, and T4. T1 always occurs at the rising edge, and T3 at the falling edge, of CLKIn. However, the spacing of T2 and T4 depends on the PLL clock ratio selected, as shown in Table 14.

Table 14. Tick Spacing for Memory Controller Signals

PLL Clock Ratio	Tick Spacing (T1 Occurs at the Rising Edge of CLKIn)		
	T2	T3	T4
1:2, 1:3, 1:4, 1:5, 1:6	1/4 CLKIn	1/2 CLKIn	3/4 CLKIn
1:2.5	3/10 CLKIn	1/2 CLKIn	8/10 CLKIn
1:3.5	4/14 CLKIn	1/2 CLKIn	11/14 CLKIn

This table is a representation of the information in Table 14.

Figure 11. Internal Tick Spacing for Memory Controller Signals

¹ The “low” values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The “high” values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user’s device. The minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. The minimum CPM frequency is 120 MHz.

² PCI_MODCK determines the PCI clock frequency range. See [Table 18](#) for lower range configurations.

³ MODCK_H = hard reset configuration word [28–31] (see Section 5.4 in the SoC reference manual). MODCK[1-3] = three hardware configuration pins.

⁴ CPM multiplication factor = CPM clock/bus clock

⁵ CPU multiplication factor = Core PLL multiplication factor

⁶ CPM_CLK/PCI_CLK ratio. When PCI_MODCK = 0, the ratio of CPM_CLK/PCI_CLK should be calculated from SCCR[PCIDF] as follows:

$$\text{CPM_CLK/PCI_CLK} = (\text{PCIDF} + 1) / 2.$$

Table 18. Clock Configurations for PCI Host Mode (PCI_MODCK=1)^{1,2}

1100_010	Reserved										

¹ The “low” values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The “high” values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user’s device. The minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. The minimum CPM frequency is 120 MHz.

² PCI_MODCK determines the PCI clock frequency range. See [Table 19](#) for higher range configurations.

³ MODCK_H = hard reset configuration word [28–31] (see Section 5.4 in the SoC reference manual). MODCK[1-3] = three hardware configuration pins.

⁴ CPM multiplication factor = CPM clock/bus clock

⁵ CPU multiplication factor = Core PLL multiplication factor

8 Pinout

This figure and table show the pin assignments and pinout for the 516 PBGA package.

¹ Must be tied to ground.

² Should be tied to VDDH via a 2K Ω external pull-up resistor.

³ The default configuration of the CPM pins (PA[8–31], PB[18–31], PC[0–1,4–29], PD[7–25, 29–31]) is input. To prevent excessive DC current, it is recommended either to pull unused pins to GND or VDDH, or to configure them as outputs.

⁴ This pin is not connected. It should be left floating.

⁵ Must be pulled down or left floating

10 Ordering Information

This figure provides an example of the Freescale part numbering nomenclature for the SoC. In addition to the processor frequency, the part numbering scheme also consists of a part modifier that indicates any enhancement(s) in the part from the original production design. Each part number also contains a revision code that refers to the die mask revision number and is specified in the part numbering scheme for identification purposes only. For more information, contact your local Freescale sales office.

Figure 15. Freescale Part Number Key

11 Document Revision History

This table summarizes changes to this document.

Table 23. Document Revision History

Revision	Date	Substantive Changes
3	09/2011	In Figure 15 , "Freescale Part Number Key," added speed decoding information below processor frequency information.
2	12/2008	- Modified Figure 5, "SCC/SMC/SPI/I2C External Clock Diagram," and added second section of figure notes. - In Table 12, modified "Data bus in pipeline mode" row and showed 66 MHz as "N/A." - In Section 10, "Ordering Information," added "F = 133" to CPU/CPM/Bus Frequency. - Added footnote concerning CPM_CLK/PCI_CLK ratio to column "PCI Division Factor" in Table 17, "Clock Configurations for PCI Host Mode (PCI_MODCK=0)," and Table 18, "Clock Configurations for PCI Host Mode (PCI_MODCK=1)." - Removed overbar from DLL_ENABLE in Table 21, "Pinout."
1.5	12/2006	Section 6, "AC Electrical Characteristics," removed deratings statement and clarified AC timing descriptions.
1.4	05/2006	Added row for 133 MHz configurations to Table 8.
1.3	02/2006	Inserted Section 6.3, "JTAG Timings."
