Understanding [Embedded - Microprocessors](#)

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of [Embedded - Microprocessors](#)

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

2 Operating Conditions

This table shows the maximum electrical ratings.

Table 3. Absolute Maximum Ratings¹

Rating	Symbol	Value	Unit
Core supply voltage ²	VDD	-0.3 – 2.25	V
PLL supply voltage ²	VCCSYN	-0.3 – 2.25	V
I/O supply voltage ³	VDDH	-0.3 – 4.0	V
Input voltage ⁴	VIN	GND(-0.3) – 3.6	V
Junction temperature	T _j	120	°C
Storage temperature range	T _{STG}	(-55) – (+150)	°C

¹ Absolute maximum ratings are stress ratings only; functional operation (see **Table 4**) at the maximums is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage.

² **Caution:** VDD/VCCSYN must not exceed VDDH by more than 0.4 V during normal operation. It is recommended that VDD/VCCSYN should be raised before or simultaneous with VDDH during power-on reset. VDD/VCCSYN may exceed VDDH by more than 0.4 V during power-on reset for no more than 100 ms.

³ **Caution:** VDDH can exceed VDD/VCCSYN by 3.3 V during power on reset by no more than 100 mSec. VDDH should not exceed VDD/VCCSYN by more than 2.5 V during normal operation.

⁴ **Caution:** VIN must not exceed VDDH by more than 2.5 V at any time, including during power-on reset.

¹ The “low” values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The “high” values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user’s device. The minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. The minimum CPM frequency is 120 MHz.

² PCI_MODCK determines the PCI clock frequency range. See [Table 18](#) for lower range configurations.

³ MODCK_H = hard reset configuration word [28–31] (see Section 5.4 in the SoC reference manual). MODCK[1-3] = three hardware configuration pins.

⁴ CPM multiplication factor = CPM clock/bus clock

⁵ CPU multiplication factor = Core PLL multiplication factor

⁶ CPM_CLK/PCI_CLK ratio. When PCI_MODCK = 0, the ratio of CPM_CLK/PCI_CLK should be calculated from SCCR[PCIDF] as follows:

$$\text{CPM_CLK/PCI_CLK} = (\text{PCIDF} + 1) / 2.$$

¹ The “low” values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The “high” values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user’s device. The minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. The minimum CPM frequency is 120 MHz.

9.1 Package Parameters

This table provides package parameters.

Table 22. Package Parameters

Code	Type	Outline (mm)	Interconnects	Pitch (mm)	Nominal Unmounted Height (mm)
VR, ZQ	PBGA	27 x 27	516	1	2.25

NOTE: Temperature Reflow for the VR Package

In the VR package, sphere composition is lead-free (see [Table 2](#)). This requires higher temperature reflow than what is required for other PowerQUICC II packages. Consult “Freescale PowerQUICC II Pb-Free Packaging Information” (MPC8250PBFREEPKG) available on www.freescale.com.

10 Ordering Information

This figure provides an example of the Freescale part numbering nomenclature for the SoC. In addition to the processor frequency, the part numbering scheme also consists of a part modifier that indicates any enhancement(s) in the part from the original production design. Each part number also contains a revision code that refers to the die mask revision number and is specified in the part numbering scheme for identification purposes only. For more information, contact your local Freescale sales office.
