Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

2 Operating Conditions

This table shows the maximum electrical ratings.

Table 3. Absolute Maximum Ratings[1]

Rating	Symbol	Value	Unit
Core supply voltage[2]	VDD	−0.3 – 2.25	V
PLL supply voltage[2]	VCCSYN	−0.3 – 2.25	V
I/O supply voltage[3]	VDDH	−0.3 – 4.0	V
Input voltage[4]	VIN	GND(−0.3) – 3.6	V
Junction temperature	T$_j$	120	°C
Storage temperature range	T$_{STG}$	(−55) – (+150)	°C

[1] Absolute maximum ratings are stress ratings only; functional operation (see Table 4) at the maximums is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage.

[2] **Caution:** VDD/VCCSYN must not exceed VDDH by more than 0.4 V during normal operation. It is recommended that VDD/VCCSYN should be raised before or simultaneous with VDDH during power-on reset. VDD/VCCSYN may exceed VDDH by more than 0.4 V during power-on reset for no more than 100 ms.

[3] **Caution:** VDDH can exceed VDD/VCCSYN by 3.3 V during power on reset by no more than 100 mSec. VDDH should not exceed VDD/VCCSYN by more than 2.5 V during normal operation.

[4] **Caution:** VIN must not exceed VDDH by more than 2.5 V at any time, including during power-on reset.

This table lists recommended operational voltage conditions.

Table 4. Recommended Operating Conditions[1]

Rating	Symbol	Value	Unit
Core supply voltage	VDD	1.425 – 575	V
PLL supply voltage	VCCSYN	1.425 – 575	V
I/O supply voltage	VDDH	3.135 – 3.465	V

Junction temperature (maximum)	T_j	105[2]	°C
Ambient temperature	T_A	0–70[2]	°C

[1] **Caution:** These are the recommended and tested operating conditions. Proper operation outside of these conditions is not guaranteed.

[2] Note that for extended temperature parts the range is (-40)$_{T_A}$ – 105$_{T_j}$.

This SoC contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (either GND or V_{CC}).

This figure shows the undershoot and overshoot voltage of the 60x bus memory interface of the SoC. Note that in PCI mode the I/O interface is different.

[1] The "low" values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The "high" values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. The minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. The minimum CPM frequency is 120 MHz.

[2] PCI_MODCK determines the PCI clock frequency range. See Table 18 for lower range configurations.

[3] MODCK_H = hard reset configuration word [28–31] (see Section 5.4 in the SoC reference manual). MODCK[1-3] = three hardware configuration pins.

[4] CPM multiplication factor = CPM clock/bus clock

[5] CPU multiplication factor = Core PLL multiplication factor

[6] CPM_CLK/PCI_CLK ratio. When PCI_MODCK = 0, the ratio of CPM_CLK/PCI_CLK should be calculated from SCCR[PCIDF] as follows:
CPM_CLK/PCI_CLK = (PCIDF + 1) / 2.

[1] The "low" values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The "high" values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. The minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. The minimum CPM frequency is 120 MHz.

[2] PCI_MODCK determines the PCI clock frequency range. See Table 17 for higher range configurations.

[3] MODCK_H = hard reset configuration word [28–31] (see Section 5.4 in the SoC reference manual). MODCK[1-3] = three hardware configuration pins.

[4] CPM multiplication factor = CPM clock/bus clock

[5] CPU multiplication factor = Core PLL multiplication factor

This table provides package parameters.

Table 22. Package Parameters

Code	Type	Outline (mm)	Interconnects	Pitch (mm)	Nominal Unmounted Height (mm)
VR, ZQ	PBGA	27 x 27	516	1	2.25

NOTE: Temperature Reflow for the VR Package

In the VR package, sphere composition is lead-free (see Table 2). This requires higher temperature reflow than what is required for other PowerQUICC II packages. Consult "Freescale PowerQUICC II Pb-Free Packaging Information" (MPC8250PBFREEPKG) available on www.freescale.com.
