

Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of **Embedded - Microprocessors**

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details

E·XF

Product Status	Active
Core Processor	PowerPC G2_LE
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	400MHz
Co-Processors/DSP	Communications; RISC CPM
RAM Controllers	DRAM, SDRAM
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100Mbps (2)
SATA	-
USB	USB 2.0 (1)
Voltage - I/O	3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	-
Package / Case	516-BBGA
Supplier Device Package	516-FPBGA (27x27)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=mpc8271zqtiea

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

Overview

- Floating-point unit (FPU) supports floating-point arithmetic
- Support for cache locking
- Low-power consumption
- Separate power supply for internal logic (1.5 V) and for I/O (3.3 V)
- Separate PLLs for G2_LE core and for the communications processor module (CPM)
 - G2_LE core and CPM can run at different frequencies for power/performance optimization
 - Internal core/bus clock multiplier that provides ratios 2:1, 2.5:1, 3:1, 3.5:1, 4:1, 4.5:1, 5:1, 5.5:1, 6:1, 7:1, 8:1
 - Internal CPM/bus clock multiplier that provides ratios 2:1, 2.5:1, 3:1, 3.5:1, 4:1, 5:1, 6:1, 8:1 ratios
- 64-bit data and 32-bit address 60x bus
 - Bus supports multiple master designs—up to two external masters
 - Supports single transfers and burst transfers
 - 64-, 32-, 16-, and 8-bit port sizes controlled by on-chip memory controller
- 60x-to-PCI bridge
 - Programmable host bridge and agent
 - 32-bit data bus, 66 MHz, 3.3 V
 - Synchronous and asynchronous 60x and PCI clock modes
 - All internal address space available to external PCI host
 - DMA for memory block transfers
 - PCI-to-60x address remapping
- System interface unit (SIU)
 - Clock synthesizer
 - Reset controller
 - Real-time clock (RTC) register
 - Periodic interrupt timer
 - Hardware bus monitor and software watchdog timer
 - IEEE 1149.1 JTAG test access port
- Eight bank memory controller
 - Glueless interface to SRAM, page mode SDRAM, DRAM, EPROM, Flash, and other user-definable peripherals
 - Byte write enables
 - 32-bit address decodes with programmable bank size
 - Three user-programmable machines, general-purpose chip-select machine, and page mode pipeline SDRAM machine
 - Byte selects for 64-bit bus width (60x)
 - Dedicated interface logic for SDRAM
- Disable CPU mode

- Integrated security engine (SEC) (MPC8272 and MPC8248 only)
 - Supports DES, 3DES, MD-5, SHA-1, AES, PKEU, RNG and RC-4 encryption algorithms in hardware
- Communications processor module (CPM)
 - Embedded 32-bit communications processor (CP) uses a RISC architecture for flexible support for communications peripherals
 - Interfaces to G2_LE core through on-chip dual-port RAM and DMA controller. (Dual-port RAM size is 16 KB plus 4 KB dedicated instruction RAM.)
 - Microcode tracing capabilities
 - Eight CPM trap registers
- Universal serial bus (USB) controller
 - Supports USB 2.0 full/low rate compatible
 - USB host mode
 - Supports control, bulk, interrupt, and isochronous data transfers
 - CRC16 generation and checking
 - NRZI encoding/decoding with bit stuffing
 - Supports both 12- and 1.5-Mbps data rates (automatic generation of preamble token and data rate configuration). Note that low-speed operation requires an external hub.
 - Flexible data buffers with multiple buffers per frame
 - Supports local loopback mode for diagnostics (12 Mbps only)
 - Supports USB slave mode
 - Four independent endpoints support control, bulk, interrupt, and isochronous data transfers
 - CRC16 generation and checking
 - CRC5 checking
 - NRZI encoding/decoding with bit stuffing
 - 12- or 1.5-Mbps data rate
 - Flexible data buffers with multiple buffers per frame
 - Automatic retransmission upon transmit error
 - Serial DMA channels for receive and transmit on all serial channels
 - Parallel I/O registers with open-drain and interrupt capability
 - Virtual DMA functionality executing memory-to-memory and memory-to-I/O transfers
 - Two fast communication controllers (FCCs) supporting the following protocols:
 - 10-/100-Mbit Ethernet/IEEE 802.3 CDMA/CS interface through media independent interface (MII)
 - Transparent
 - HDLC—up to T3 rates (clear channel)

 State

² Note that for extended temperature parts the range is $(-40)_{T_A} - 105_{T_i}$.

This SoC contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (either GND or V_{CC}).

This figure shows the undershoot and overshoot voltage of the 60x bus memory interface of the SoC. Note that in PCI mode the I/O interface is different.

This table lists CPM input characteristics.

NOTE: Rise/Fall Time on CPM Input Pins

It is recommended that the rise/fall time on CPM input pins should not exceed 5 ns. This should be enforced especially on clock signals. Rise time refers to signal transitions from 10% to 90% of VCC; fall time refers to transitions from 90% to 10% of VCC.

Spec N	lumber		Value (ns)										
		Characteristic		Se	tup		Hold						
Setup	Hold		66 MHz	83 MHz	100 MHz	133 MHz	66 MHz	83 MHz	100 MHz	133 MHz

sp16b	sp17b	FCC inputs—external clock (NMSI)	2.5	2.5	2.5	2.5	2	2	2	2			
sp18a	sp19a	SCC/SMC/SPI/I2C inputs—internal clock (NMSI)	6	6	6	6	0	0	0	0			
sp18b	sp19b	SCC/SMC/SPI/I2C inputs—external clock (NMSI)		4	4	4	2	2	2	2			
sp20	sp21	TDM inputs/SI	3	3	3	3	2.5	2.5	2.5	2.5			
sp22	sp23	PIO/TIMER/IDMA inputs	8	8	8	8	0.5	0.5	0.5	0.5			

Table 11. AC Characteristics for CPM Inputs¹

¹ Input specifications are measured from the 50% level of the signal to the 50% level of the rising edge of CLKIN. Timings are measured at the pin.

NOTE

Although the specifications generally reference the rising edge of the clock, the following AC timing diagrams also apply when the falling edge is the active edge.

This figure shows the FCC internal clock.

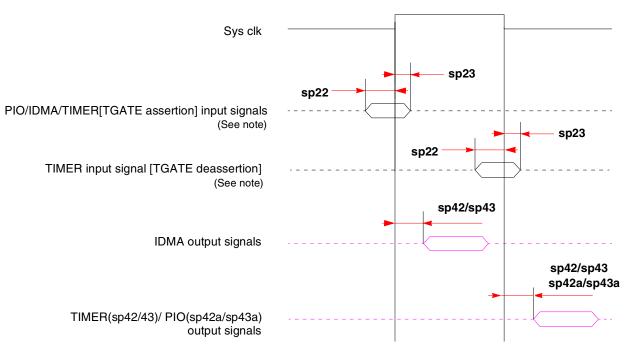

Figure 3. FCC Internal Clock Diagram

AC Electrical Characteristics

This figure shows PIO and timer signals.

Note: TGATE is asserted on the rising edge of the clock; it is deasserted on the falling edge.

Figure 8. PIO and Timer Signal Diagram

6.2 SIU AC Characteristics

This table lists SIU input characteristics.

NOTE: CLKIN Jitter and Duty Cycle

The CLKIN input to the SoC should not exceed +/- 150 psec of jitter (peak-to-peak). This represents total input jitter—the combination of short term (peak-to-peak) and long term (cumulative). The duty cycle of CLKIN should not exceed the ratio of 40:60.

NOTE: Spread Spectrum Clocking

Spread spectrum clocking is allowed with 1% input frequency down-spread at maximum 60 KHz modulation rate regardless of input frequency.

NOTE: PCI AC Timing

The SoC meets the timing requirements of *PCI Specification Revision 2.2.* See Section 7, "Clock Configuration Modes," and "Note: Tval (Output Hold)" to determine if a specific clock configuration is compliant.

NOTE

Activating data pipelining (setting BRx[DR] in the memory controller) improves the AC timing.

This figure shows the interaction of several bus signals.

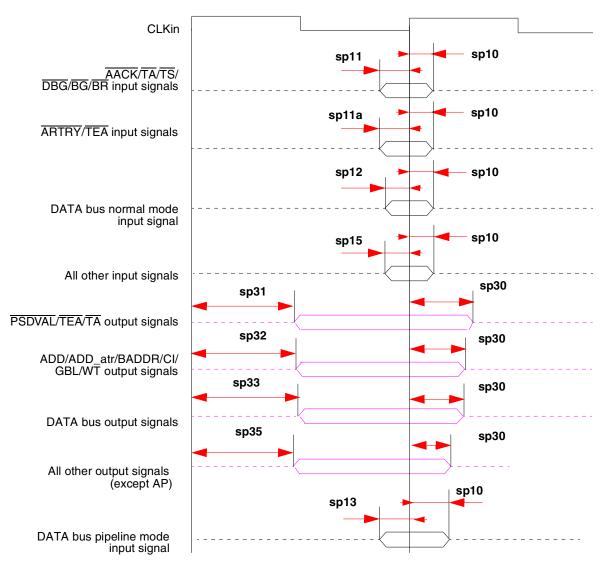

Figure 9. Bus Signals

AC Electrical Characteristics

This figure shows signal behavior in MEMC mode.

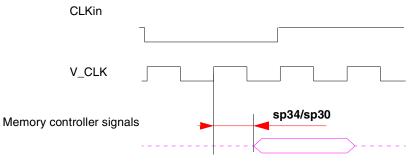

Figure 10. MEMC Mode Diagram

NOTE

Generally, all SoC bus and system output signals are driven from the rising edge of the input clock (CLKin). Memory controller signals, however, trigger on four points within a CLKin cycle. Each cycle is divided by four internal ticks: T1, T2, T3, and T4. T1 always occurs at the rising edge, and T3 at the falling edge, of CLKin. However, the spacing of T2 and T4 depends on the PLL clock ratio selected, as shown in Table 14.

Table 14.	. Tick Spacing for Memory Controller Signals
-----------	--

PLL Clock Ratio	Tick Spacing (T1 Occurs at the Rising Edge of CLKin)							
	T2	тз	Τ4					
1:2, 1:3, 1:4, 1:5, 1:6	1/4 CLKin	1/2 CLKin	3/4 CLKin					
1:2.5	3/10 CLKin	1/2 CLKin	8/10 CLKin					
1:3.5	4/14 CLKin	1/2 CLKin	11/14 CLKin					

This table is a representation of the information in Table 14.

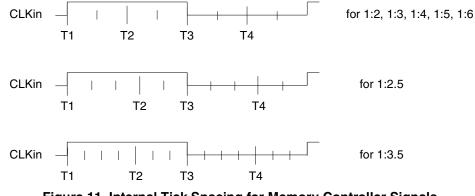

Figure 11. Internal Tick Spacing for Memory Controller Signals

7 Clock Configuration Modes

As shown in this table, the clocking mode is set according to two sources:

- PCI_CFG[0]— An input signal. Also defined as "PCI_HOST_EN." See Chapter 6, "External Signals," and Chapter 9, "PCI Bridge," in the SoC reference manual.
- PCI_MODCK—Bit 27 in the Hard Reset Configuration Word. See Chapter 5, "Reset," in the SoC reference manual.

Pi	ns	Clocking Mode	PCI Clock Frequency Range (MHz)	Reference		
PCI_CFG[0] ¹	PCI_MODCK ²	Clocking Mode	Torolock rrequency hange (Milz)			
0	0	PCI host	50–66	Table 17		
0	1		25–50	Table 18		
1	0	PCI agent	50–66	Table 19		
1	1		25–50	Table 20		

Table 16. SoC Clocking Modes

¹ PCI_HOST_EN

² Determines PCI clock frequency range.

Within each mode, the configuration of bus, core, PCI, and CPM frequencies is determined by seven bits during the power-on reset—three hardware configuration pins (MODCK[1–3]) and four bits from hardware configuration word[28–31] (MODCK_H). Both the PLLs and the dividers are set according to the selected clock operation mode as described in the following sections.

NOTE

Clock configurations change only after PORESET is asserted.

NOTE: Tval (Output Hold)

The minimum Tval = 2 ns when $PCI_MODCK = 1$, and the minimum Tval = 1 ns when $PCI_MODCK = 0$. Therefore, designers should use clock configurations that fit this condition to achieve PCI-compliant AC timing.

7.1 PCI Host Mode

These tables show configurations for PCI host mode. The frequency values listed are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. Note that in PCI host mode the input clock is the bus clock.

Table 17. Clock Configurations for PCI Host Mode (PC	I_MODCK=0) ^{1,2} (continued)
--	---------------------------------------

¹ The "low" values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The "high" values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. The minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. The minimum CPM frequency is 120 MHz.

² PCI_MODCK determines the PCI clock frequency range. SeeTable 18 for lower range configurations.

³ MODCK_H = hard reset configuration word [28–31] (see Section 5.4 in the SoC reference manual). MODCK[1-3] = three hardware configuration pins.

⁴ CPM multiplication factor = CPM clock/bus clock

⁵ CPU multiplication factor = Core PLL multiplication factor

⁶ CPM_CLK/PCI_CLK ratio. When PCI_MODCK = 0, the ratio of CPM_CLK/PCI_CLK should be calculated from SCCR[PCIDF] as follows:

 $CPM_CLK/PCI_CLK = (PCIDF + 1) / 2.$

Clock Configuration Modes

- ⁶ CPM_CLK/PCI_CLK ratio. When PCI_MODCK = 1, the ratio of CPM_CLK/PCI_CLK should be calculated from PCIDF as follows: PCIDF = 3 > CPM_CLK/PCI_CLK = 4 PCIDF = 5 > CPM_CLK/PCI_CLK = 6 PCIDF = 7 > CPM_CLK/PCI_CLK = 8
 - PCIDF = 9 > CPM_CLK/PCI_CLK = 5
 - PCIDF = B > CPM_CLK/PCI_CLK = 6

7.2 PCI Agent Mode

These tables show configurations for PCI agent mode. The frequency values listed are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. Note that in PCI agent mode the input clock is PCI clock.

Table 19. Clock Configurations for PCI Agent Mode (PCI_MODCK=0)^{1,2} (continued)

¹ The "low" values are the minimum allowable frequencies for a given clock mode. The minimum bus frequency in a table entry guarantees only the required minimum CPU operating frequency. The "high" values are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. The minimum CPU frequency is 150 MHz for commercial temperature devices and 175 MHz for extended temperature devices. The minimum CPM frequency is 120 MHz.

² PCI_MODCK determines the PCI clock frequency range. See Table 20 for lower range configurations.

- ³ MODCK_H = hard reset configuration word [28–31] (see Section 5.4 in the SoC reference manual). MODCK[1-3] = three hardware configuration pins.
- ⁴ CPM multiplication factor = CPM clock/bus clock

⁵ CPU multiplication factor = Core PLL multiplication factor

Mode ³		Clock Hz)	CPM Multiplication		Clock Hz)	CPU Multiplication		Clock Hz)	Bus Division		Clock Hz)

8 Pinout

This figure and table show the pin assignments and pinout for the 516 PBGA package.

This figure shows the pinout of the 516 PBGA package as viewed from the top surface.

Not to Scale

Figure 12. Pinout of the 516 PBGA Package (View from Top)

This table lists the pins of the MPC8272. Note that the pins in the "MPC8272/8271 Only" column relate to Utopia functionality.

Ordering Information

10 Ordering Information

This figure provides an example of the Freescale part numbering nomenclature for the SoC. In addition to the processor frequency, the part numbering scheme also consists of a part modifier that indicates any enhancement(s) in the part from the original production design. Each part number also contains a revision code that refers to the die mask revision number and is specified in the part numbering scheme for identification purposes only. For more information, contact your local Freescale sales office.

Figure 15. Freescale Part Number Key

11 Document Revision History

This table summarizes changes to this document.

Table 23. Document Revision History

Revision	Date	Substantive Changes
3	09/2011	In Figure 15, "Freescale Part Number Key," added speed decoding information below processor frequency information.
2	12/2008	 Modified Figure 5, "SCC/SMC/SPI/I2C External Clock Diagram," and added second section of figure notes. In Table 12, modified "Data bus in pipeline mode" row and showed 66 MHz as "N/A." In Section 10, "Ordering Information," added "F = 133" to CPU/CPM/Bus Frequency. Added footnote concerning CPM_CLK/PCI_CLK ratio to column "PCI Division Factor" in Table 17, "Clock Configurations for PCI Host Mode (PCI_MODCK=0)," and Table 18, "Clock Configurations for PCI Host Mode (PCI_MODCK=1),." Removed overbar from DLL_ENABLE in Table 21, "Pinout."
1.5	12/2006	• Section 6, "AC Electrical Characteristics," removed deratings statement and clarified AC timing descriptions.
1.4	05/2006	Added row for 133 MHz configurations to Table 8.
1.3	02/2006	Inserted Section 6.3, "JTAG Timings."
