Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

1.1 Features

The major features of the SoC are as follows:

- Dual-issue integer (G2_LE) core
  - A core version of the MPC603e microprocessor
  - System core microprocessor supporting frequencies of 266–400 MHz
  - Separate 16 KB data and instruction caches:
    - Four-way set associative
    - Physically addressed
    - LRU replacement algorithm
  - Power Architecture®-compliant memory management unit (MMU)
  - Common on-chip processor (COP) test interface
  - Supports bus snooping for cache coherency

  - Floating-point unit (FPU) supports floating-point arithmetic
  - Support for cache locking
- Low-power consumption
- Separate power supply for internal logic (1.5 V) and for I/O (3.3 V)
- Separate PLLs for G2_LE core and for the communications processor module (CPM)
  - G2_LE core and CPM can run at different frequencies for power/performance optimization
  - Internal core/bus clock multiplier that provides ratios 2:1, 2.5:1, 3:1, 3.5:1, 4:1, 4.5:1, 5:1, 5.5:1, 6:1, 7:1, 8:1
  - Internal CPM/bus clock multiplier that provides ratios 2:1, 2.5:1, 3:1, 3.5:1, 4:1, 5:1, 6:1, 8:1 ratios
- 64-bit data and 32-bit address 60x bus
  - Bus supports multiple master designs—up to two external masters
  - Supports single transfers and burst transfers
  - 64-, 32-, 16-, and 8-bit port sizes controlled by on-chip memory controller
- 60x-to-PCI bridge
  - Programmable host bridge and agent
  - 32-bit data bus, 66 MHz, 3.3 V
  - Synchronous and asynchronous 60x and PCI clock modes
  - All internal address space available to external PCI host
  - DMA for memory block transfers
    - PCI-to-60x address remapping
- System interface unit (SIU)
  - Clock synthesizer
  - Reset controller
  - Real-time clock (RTC) register
  - Periodic interrupt timer
  - Hardware bus monitor and software watchdog timer
  - IEEE 1149.1 JTAG test access port
- Eight bank memory controller
  - Glueless interface to SRAM, page mode SDRAM, DRAM, EPROM, Flash, and other user-definable peripherals
  - Byte write enables
  - 32-bit address decodes with programmable bank size
  - Three user-programmable machines, general-purpose chip-select machine, and page mode pipeline SDRAM machine
  - Byte selects for 64-bit bus width (60x)
  - Dedicated interface logic for SDRAM
- Disable CPU mode

3 DC Electrical Characteristics

This table shows DC electrical characteristics.

Table 5. DC Electrical Characteristics[1]

Characteristic	Symbol	Min	Max	Unit
Input high voltage—all inputs except TCK, $\overline{\text{TRST}}$ and $\overline{\text{PORESET}}$[2]	V_{IH}	2.0	3.465	V
Input low voltage[3]	V_{IL}	GND	0.8	V
CLKIN input high voltage	V_{IHC}	2.4	3.465	V
CLKIN input low voltage	V_{ILC}	GND	0.4	V

1 TCK, TRST and PORESET have min VIH = 2.5V.

2 The leakage current is measured for nominal VDDH,VCCSYN, and VDD.

3 V_{IL} for IIC interface does not match IIC standard, but does meet IIC standard for V_{OL} and should not cause any compatibility issue.

4.2 Estimation with Junction-to-Case Thermal Resistance

Historically, the thermal resistance has frequently been expressed as the sum of a junction-to-case thermal resistance and a case-to-ambient thermal resistance:

$$R_{\theta JA} = R_{\theta JC} + R_{\theta CA}$$

where:

$R_{\theta JA}$ = junction-to-ambient thermal resistance (ºC/W)

$R_{\theta JC}$ = junction-to-case thermal resistance (ºC/W)

$R_{\theta CA}$ = case-to-ambient thermal resistance (ºC/W)

$R_{\theta JC}$ is device related and cannot be influenced by the user. The user adjusts the thermal environment to affect the case-to-ambient thermal resistance, $R_{\theta CA}$. For instance, the user can change the air flow around the device, add a heat sink, change the mounting arrangement on the printed circuit board, or change the thermal dissipation on the printed circuit board surrounding the device. This thermal model is most useful for ceramic packages with heat sinks where some 90% of the heat flows through the case and the heat sink to the ambient environment. For most packages, a better model is required.

4.3 Estimation with Junction-to-Board Thermal Resistance

A simple package thermal model which has demonstrated reasonable accuracy (about 20%) is a two-resistor model consisting of a junction-to-board and a junction-to-case thermal resistance. The junction-to-case thermal resistance covers the situation where a heat sink is used or where a substantial amount of heat is dissipated from the top of the package. The junction-to-board thermal resistance describes the thermal performance when most of the heat is conducted to the printed circuit board. It has been observed that the thermal performance of most plastic packages, especially PBGA packages, is strongly dependent on the board temperature.

If the board temperature is known, an estimate of the junction temperature in the environment can be made using the following equation:

$$T_J = T_B + (R_{\theta JB} \times P_D)$$

where:

$R_{\theta JB}$ = junction-to-board thermal resistance (ºC/W)

T_B = board temperature (ºC)

P_D = power dissipation in package

If the board temperature is known and the heat loss from the package case to the air can be ignored, acceptable predictions of junction temperature can be made. For this method to work, the board and board mounting must be similar to the test board used to determine the junction-to-board thermal resistance, namely a 2s2p (board with a power and a ground plane) and by attaching the thermal balls to the ground plane.

5 Power Dissipation

This table provides preliminary, estimated power dissipation for various configurations. Note that suitable thermal management is required to ensure the junction temperature does not exceed the maximum specified value. Also note that the I/O power should be included when determining whether to use a heat sink. For a complete list of possible clock configurations, see Section 7, “Clock Configuration Modes.”

Table 8. Estimated Power Dissipation for Various Configurations[1]

Bus (MHz)	CPM Multiplication Factor	CPM (MHz)	CPU Multiplication Factor	CPU (MHz)	P_{INT}(W)[2,3]	
					Vddl 1.5 Volts	
					Nominal	Maximum
66.67	3	200	4	266	1	1.2
100	2	200	3	300	1.1	1.3
100	2	200	4	400	1.3	1.5
133	2	267	3	400	1.5	1.8

1 Test temperature = 105° C
2 $P_{INT} = I_{DD} \times V_{DD}$ Watts
3 Values do not include I/O. Add the following estimates for active I/O based on the following bus speeds:
66.7 MHz = 0.35 W (nominal), 0.4 W (maximum)
83.3 MHz = 0.4 W (nominal), 0.5 W (maximum)
100 MHz = 0.5 W (nominal), 0.6 W (maximum)
133 MHz = 0.7 W (nominal), 0.8 W (maximum)

6 AC Electrical Characteristics

The following sections include illustrations and tables of clock diagrams, signals, and CPM outputs and inputs for 66.67/83.33/100/133 MHz devices. Note that AC timings are based on a 50-pf load for MAX Delay and 10-pf load for MIN delay. Typical output buffer impedances are shown in this table.

Table 9. Output Buffer Impedances[1]

Output Buffers	Typical Impedance (Ω)
60x bus	45 or 27[2]
Memory controller	45 or 27[2]
Parallel I/O	45
PCI	27

1 These are typical values at 65° C. Impedance may vary by ±25% with process and temperature.
2 Impedance value is selected through SIUMCR[20,21]. See the SoC reference manual.

1 Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.

This table lists CPM input characteristics.

NOTE: Rise/Fall Time on CPM Input Pins

It is recommended that the rise/fall time on CPM input pins should not exceed 5 ns. This should be enforced especially on clock signals. Rise time refers to signal transitions from 10% to 90% of VCC; fall time refers to transitions from 90% to 10% of VCC.

1 Input specifications are measured from the 50% level of the signal to the 50% level of the rising edge of CLKIN. Timings are measured at the pin.

NOTE

Although the specifications generally reference the rising edge of the clock, the following AC timing diagrams also apply when the falling edge is the active edge.

This figure shows the FCC internal clock.

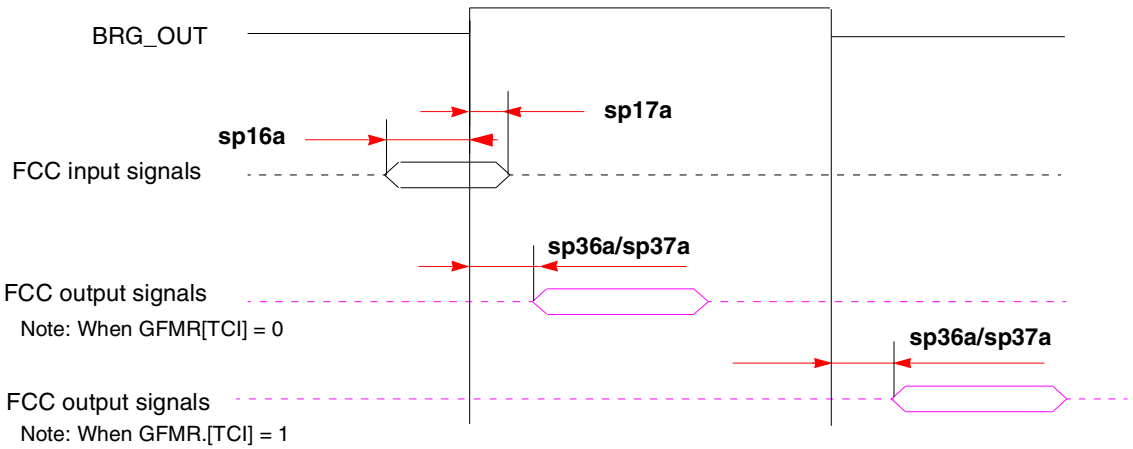

Figure 3. FCC Internal Clock Diagram

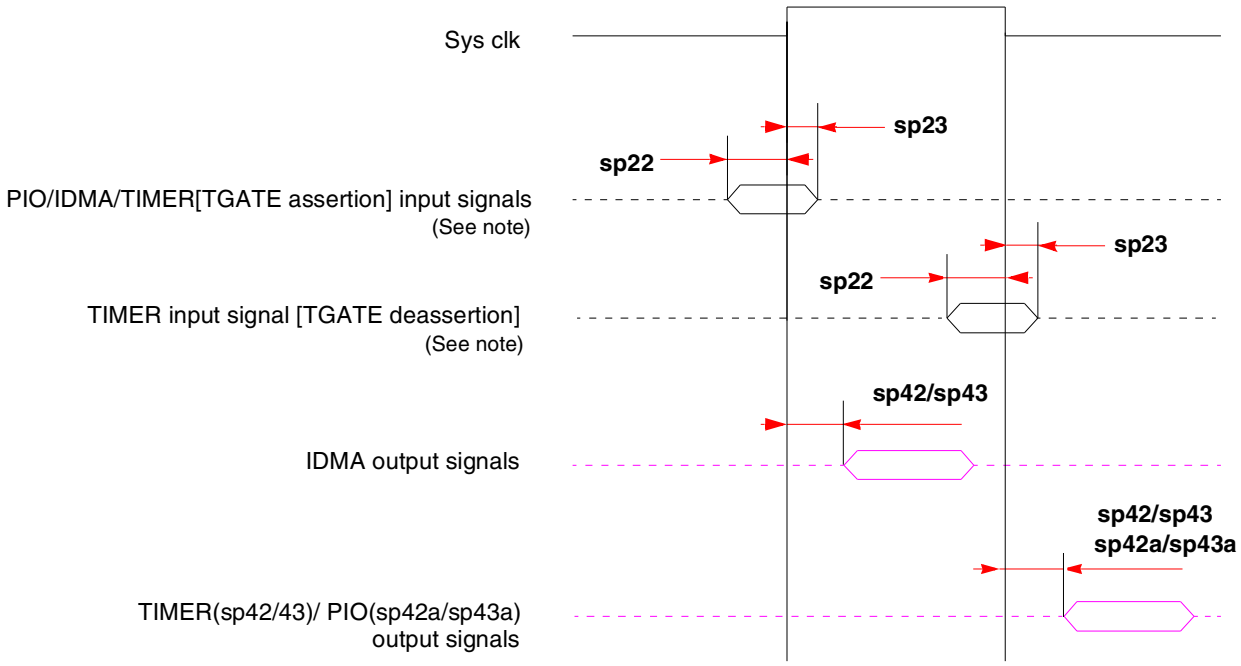
This figure shows PIO and timer signals.



Note: TGATE is asserted on the rising edge of the clock; it is deasserted on the falling edge.

Figure 8. PIO and Timer Signal Diagram

6.2 SIU AC Characteristics

This table lists SIU input characteristics.

NOTE: CLKIN Jitter and Duty Cycle

The CLKIN input to the SoC should not exceed +/– 150 psec of jitter (peak-to-peak). This represents total input jitter—the combination of short term (peak-to-peak) and long term (cumulative). The duty cycle of CLKIN should not exceed the ratio of 40:60.

NOTE: Spread Spectrum Clocking

Spread spectrum clocking is allowed with 1% input frequency down-spread at maximum 60 KHz modulation rate regardless of input frequency.

NOTE: PCI AC Timing

The SoC meets the timing requirements of *PCI Specification Revision 2.2*. See Section 7, “Clock Configuration Modes,” and “Note: Tval (Output Hold)” to determine if a specific clock configuration is compliant.

NOTE

Activating data pipelining (setting BR*x*[DR] in the memory controller) improves the AC timing.

This figure shows the interaction of several bus signals.

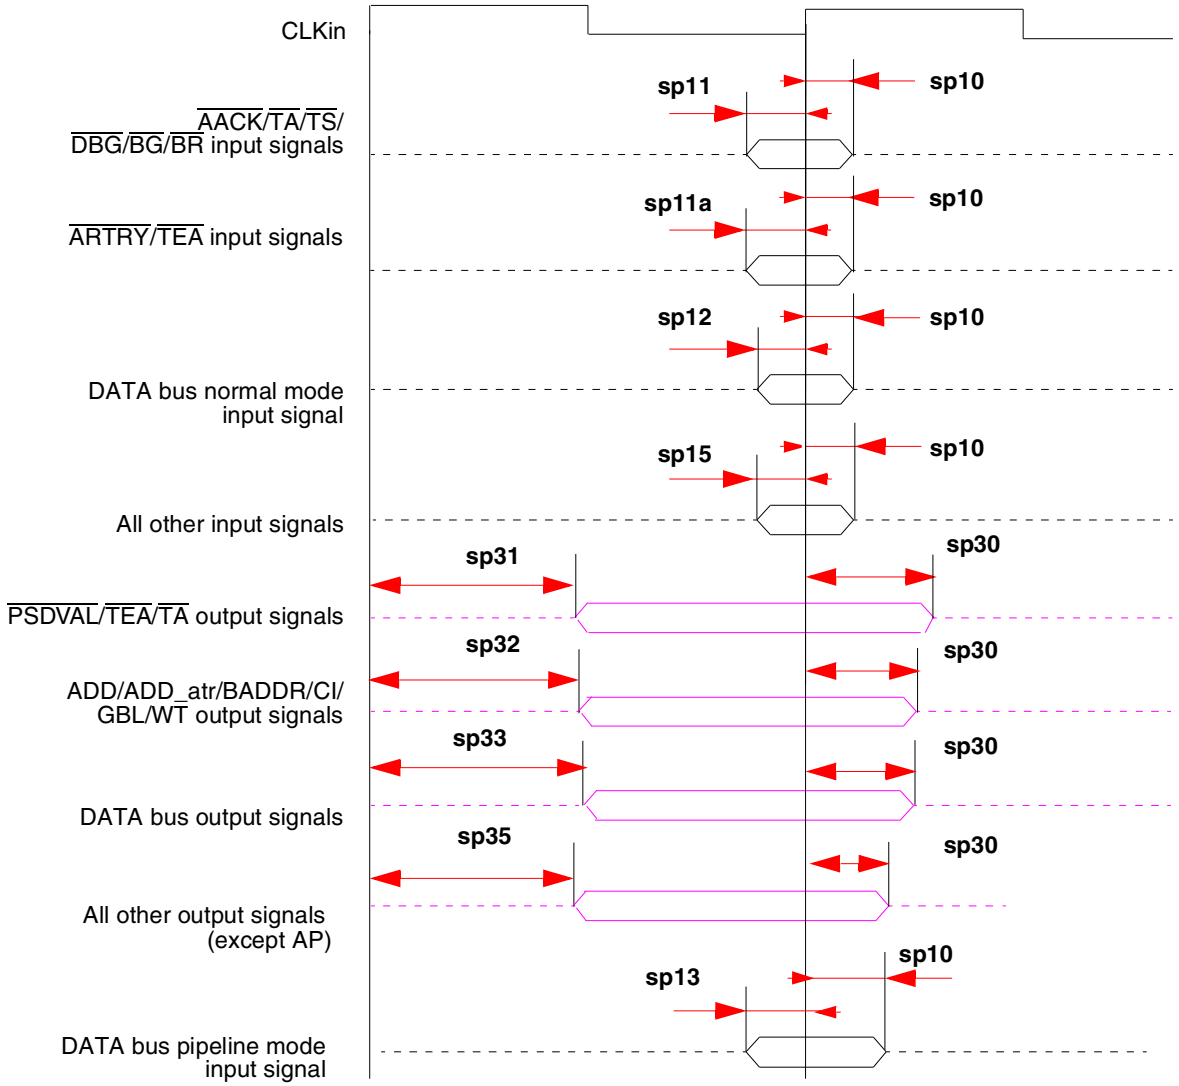


Figure 9. Bus Signals

This figure shows signal behavior in MEMC mode.

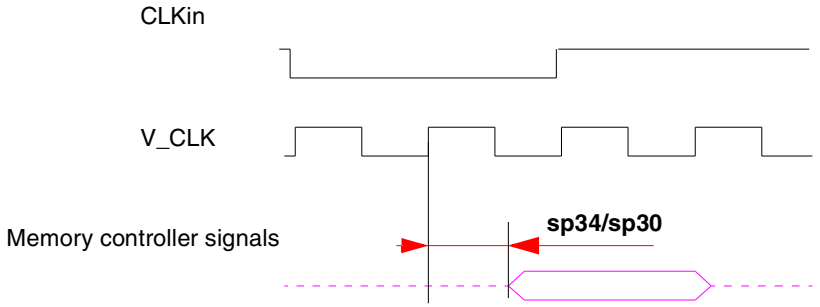

Figure 10. MEMC Mode Diagram

NOTE

Generally, all SoC bus and system output signals are driven from the rising edge of the input clock (CLKin). Memory controller signals, however, trigger on four points within a CLKin cycle. Each cycle is divided by four internal ticks: T1, T2, T3, and T4. T1 always occurs at the rising edge, and T3 at the falling edge, of CLKin. However, the spacing of T2 and T4 depends on the PLL clock ratio selected, as shown in Table 14.

Table 14. Tick Spacing for Memory Controller Signals

PLL Clock Ratio	Tick Spacing (T1 Occurs at the Rising Edge of CLKin)		
	T2	T3	T4
1:2, 1:3, 1:4, 1:5, 1:6	1/4 CLKin	1/2 CLKin	3/4 CLKin
1:2.5	3/10 CLKin	1/2 CLKin	8/10 CLKin
1:3.5	4/14 CLKin	1/2 CLKin	11/14 CLKin

This table is a representation of the information in Table 14.

1 Must be tied to ground.

2 Should be tied to VDDH via a 2K Ω external pull-up resistor.

3 The default configuration of the CPM pins (PA[8–31], PB[18–31], PC[0–1,4–29], PD[7–25, 29–31]) is input. To prevent excessive DC current, it is recommended either to pull unused pins to GND or VDDH, or to configure them as outputs.

4 This pin is not connected. It should be left floating.

5 Must be pulled down or left floating

9 Package Description

This figure shows the side profile of the PBGA package to indicate the direction of the top surface view.

9.1 Package Parameters

This table provides package parameters.

Table 22. Package Parameters

Code	Type	Outline (mm)	Interconnects	Pitch (mm)	Nominal Unmounted Height (mm)
VR, ZQ	PBGA	27 x 27	516	1	2.25

NOTE: Temperature Reflow for the VR Package

In the VR package, sphere composition is lead-free (see Table 2). This requires higher temperature reflow than what is required for other PowerQUICC II packages. Consult “Freescale PowerQUICC II Pb-Free Packaging Information” (MPC8250PBFREEPKG) available on www.freescale.com.

10 Ordering Information

This figure provides an example of the Freescale part numbering nomenclature for the SoC. In addition to the processor frequency, the part numbering scheme also consists of a part modifier that indicates any enhancement(s) in the part from the original production design. Each part number also contains a revision code that refers to the die mask revision number and is specified in the part numbering scheme for identification purposes only. 11 Document Revision History

This table summarizes changes to this document.

Table 23. Document Revision History

Revision	Date	Substantive Changes
3	09/2011	In Figure 15, “Freescale Part Number Key,” added speed decoding information below processor frequency information.
2	12/2008	• Modified Figure 5, “SCC/SMC/SPI/I2C External Clock Diagram,” and added second section of figure notes. • In Table 12, modified “Data bus in pipeline mode” row and showed 66 MHz as “N/A.” • In Section 10, “Ordering Information,” added “F = 133” to CPU/CPM/Bus Frequency. • Added footnote concerning CPM_CLK/PCI_CLK ratio to column “PCI Division Factor” in Table 17, “Clock Configurations for PCI Host Mode (PCI_MODCK=0),” and Table 18, “Clock Configurations for PCI Host Mode (PCI_MODCK=1),.” • Removed overbar from DLL_ENABLE in Table 21, “Pinout.”
1.5	12/2006	• Section 6, “AC Electrical Characteristics,” removed deratings statement and clarified AC timing descriptions.
1.4	05/2006	• Added row for 133 MHz configurations to Table 8.
1.3	02/2006	• Inserted Section 6.3, “JTAG Timings.”
