Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

2 Operating Conditions

This table shows the maximum electrical ratings.

Table 3. Absolute Maximum Ratings[1]

Rating	Symbol	Value	Unit
Core supply voltage[2]	VDD	–0.3 – 2.25	V
PLL supply voltage[2]	VCCSYN	–0.3 – 2.25	V
I/O supply voltage[3]	VDDH	–0.3 – 4.0	V
Input voltage[4]	VIN	GND(–0.3) – 3.6	V
Junction temperature	T_j	120	°C

1 Absolute maximum ratings are stress ratings only; functional operation (see Table 4) at the maximums is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage.

2 **Caution:** VDD/VCCSYN must not exceed VDDH by more than 0.4 V during normal operation. It is recommended that VDD/VCCSYN should be raised before or simultaneous with VDDH during power-on reset. VDD/VCCSYN may exceed VDDH by more than 0.4 V during power-on reset for no more than 100 ms.

3 **Caution:** VDDH can exceed VDD/VCCSYN by 3.3 V during power on reset by no more than 100 mSec. VDDH should not exceed VDD/VCCSYN by more than 2.5 V during normal operation.

4 **Caution:** VIN must not exceed VDDH by more than 2.5 V at any time, including during power-on reset.

6 AC Electrical Characteristics

The following sections include illustrations and tables of clock diagrams, signals, and CPM outputs and inputs for 66.67/83.33/100/133 MHz devices. Note that AC timings are based on a 50-pf load for MAX Delay and 10-pf load for MIN delay. Typical output buffer impedances are shown in this table.

Table 9. Output Buffer Impedances[1]

Output Buffers	Typical Impedance (Ω)
60x bus	45 or 27[2]
Memory controller	45 or 27[2]
Parallel I/O	45
PCI	27

1 These are typical values at 65° C. Impedance may vary by ±25% with process and temperature.
2 Impedance value is selected through SIUMCR[20,21]. See the SoC reference manual.

This table lists CPM output characteristics.

1 Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.

NOTE: Conditions

The following conditions must be met in order to operate the MPC8272 family devices with 133 MHz bus: single PowerQUICC II Bus mode must be used (no external master, BCR[EBM] = 0); data bus must be in Pipeline mode (BRx[DR] = 1); internal arbiter and memory controller must be used. For expected load of above 40 pF, it is recommended that data and address buses be configured to low (25 Ω) impedance (SIUMCR[HLBE0] = 1, SIUMCR[HLBE1] = 1).

7 Clock Configuration Modes

As shown in this table, the clocking mode is set according to two sources:

- PCI_CFG[0]— An input signal. Also defined as "$\overline{\text{PCI\_HOST\_EN}}$." See Chapter 6, "External Signals," and Chapter 9, "PCI Bridge," in the SoC reference manual.
- PCI_MODCK—Bit 27 in the Hard Reset Configuration Word. See Chapter 5, "Reset," in the SoC reference manual.

Table 16. SoC Clocking Modes

Pins		Clocking Mode	PCI Clock Frequency Range (MHz)	Reference
PCI_CFG[0][1]	PCI_MODCK[2]			
0	0	PCI host	50–66	Table 17
0	1		25–50	Table 18
1	0	PCI agent	50–66	Table 19
1	1		25–50	Table 20

1 PCI_HOST_EN
2 Determines PCI clock frequency range.

Within each mode, the configuration of bus, core, PCI, and CPM frequencies is determined by seven bits during the power-on reset—three hardware configuration pins (MODCK[1–3]) and four bits from hardware configuration word[28–31] (MODCK_H). Both the PLLs and the dividers are set according to the selected clock operation mode as described in the following sections.

NOTE

Clock configurations change only after $\overline{\text{PORESET}}$ is asserted.

NOTE: Tval (Output Hold)

The minimum Tval = 2 ns when PCI_MODCK = 1, and the minimum Tval = 1 ns when PCI_MODCK = 0. Therefore, designers should use clock configurations that fit this condition to achieve PCI-compliant AC timing.

7.1 PCI Host Mode

These tables show configurations for PCI host mode. The frequency values listed are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. Note that in PCI host mode the input clock is the bus clock.

6 CPM_CLK/PCI_CLK ratio. When PCI_MODCK = 1, the ratio of CPM_CLK/PCI_CLK should be calculated from PCIDF as follows:
PCIDF = 3 > CPM_CLK/PCI_CLK = 4
PCIDF = 5 > CPM_CLK/PCI_CLK = 6
PCIDF = 7 > CPM_CLK/PCI_CLK = 8
PCIDF = 9 > CPM_CLK/PCI_CLK = 5
PCIDF = B > CPM_CLK/PCI_CLK = 6

7.2 PCI Agent Mode

These tables show configurations for PCI agent mode. The frequency values listed are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. Note that in PCI agent mode the input clock is PCI clock.

10 Ordering Information

This figure provides an example of the Freescale part numbering nomenclature for the SoC. In addition to the processor frequency, the part numbering scheme also consists of a part modifier that indicates any enhancement(s) in the part from the original production design. Each part number also contains a revision code that refers to the die mask revision number and is specified in the part numbering scheme for identification purposes only. For more information, contact your local Freescale sales office.
