What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

2 Operating Conditions

This table shows the maximum electrical ratings.

Table 3. Absolute Maximum Ratings[1]

Rating	Symbol	Value	Unit
Core supply voltage[2]	VDD	–0.3 – 2.25	V
PLL supply voltage[2]	VCCSYN	–0.3 – 2.25	V
I/O supply voltage[3]	VDDH	–0.3 – 4.0	V
Input voltage[4]	VIN	GND(–0.3) – 3.6	V
Junction temperature	T_j	120	°C
Storage temperature range	T_{STG}	(–55) – (+150)	°C

1 Absolute maximum ratings are stress ratings only; functional operation (see Table 4) at the maximums is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage.

2 **Caution:** VDD/VCCSYN must not exceed VDDH by more than 0.4 V during normal operation. It is recommended that VDD/VCCSYN should be raised before or simultaneous with VDDH during power-on reset. VDD/VCCSYN may exceed VDDH by more than 0.4 V during power-on reset for no more than 100 ms.

3 **Caution:** VDDH can exceed VDD/VCCSYN by 3.3 V during power on reset by no more than 100 mSec. VDDH should not exceed VDD/VCCSYN by more than 2.5 V during normal operation.

4 **Caution:** VIN must not exceed VDDH by more than 2.5 V at any time, including during power-on reset.

1 The default configuration of the CPM pins (PA[8–31], PB[18–31], PC[0–1,4–29], PD[7–25, 29–31]) is input. To prevent excessive DC current, it is recommended either to pull unused pins to GND or VDDH, or to configure them as outputs.

2 TCK, TRST and PORESET have min VIH = 2.5V.

3 V_{IL} for IIC interface does not match IIC standard, but does meet IIC standard for V_{OL} and should not cause any compatibility issue.

4 The leakage current is measured for nominal VDDH,VCCSYN, and VDD.

This table provides preliminary, estimated power dissipation for various configurations. Note that suitable thermal management is required to ensure the junction temperature does not exceed the maximum specified value. Also note that the I/O power should be included when determining whether to use a heat sink. For a complete list of possible clock configurations, see Section 7, “Clock Configuration Modes.”

1 Output specifications are measured from the 50% level of the rising edge of CLKIN to the 50% level of the signal. Timings are measured at the pin.

This table lists CPM input characteristics.

NOTE: Rise/Fall Time on CPM Input Pins

It is recommended that the rise/fall time on CPM input pins should not exceed 5 ns. This should be enforced especially on clock signals. Rise time refers to signal transitions from 10% to 90% of VCC; fall time refers to transitions from 90% to 10% of VCC.

1 Input specifications are measured from the 50% level of the signal to the 50% level of the rising edge of CLKIN. Timings are measured at the pin.

NOTE

Although the specifications generally reference the rising edge of the clock, the following AC timing diagrams also apply when the falling edge is the active edge.

This figure shows the FCC internal clock.

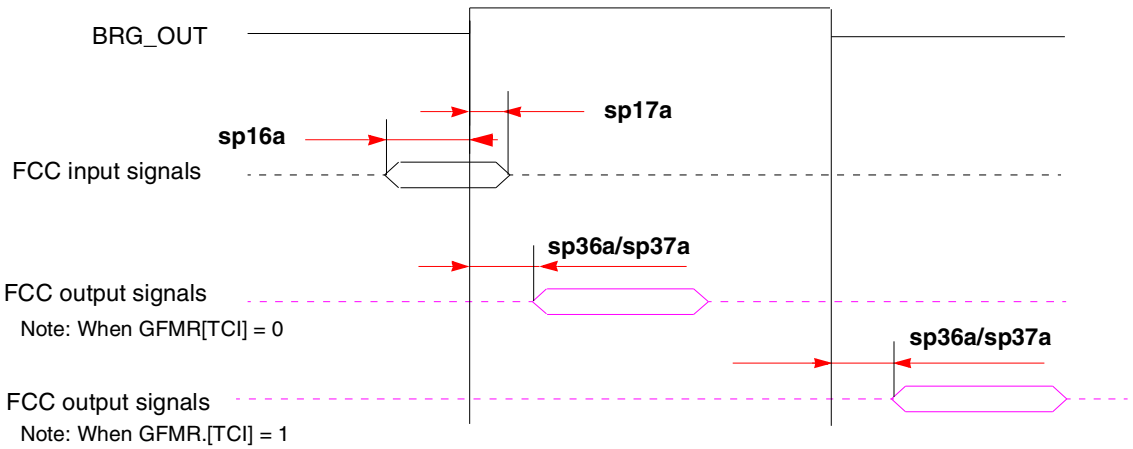

Figure 3. FCC Internal Clock Diagram

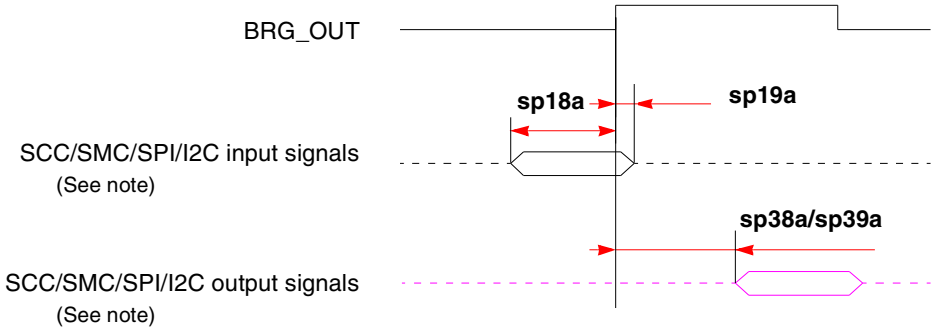
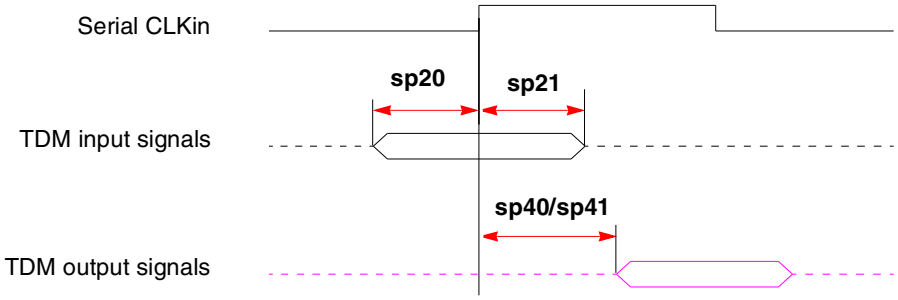
This figure shows the SCC/SMC/SPI/I^{2}C internal clock.



Note: There are four possible timing conditions for SCC and SPI:
1. Input sampled on the rising edge and output driven on the rising edge (shown).
2. Input sampled on the rising edge and output driven on the falling edge.
3. Input sampled on the falling edge and output driven on the falling edge.
4. Input sampled on the falling edge and output driven on the rising edge.

Figure 6. SCC/SMC/SPI/I^{2}C Internal Clock Diagram

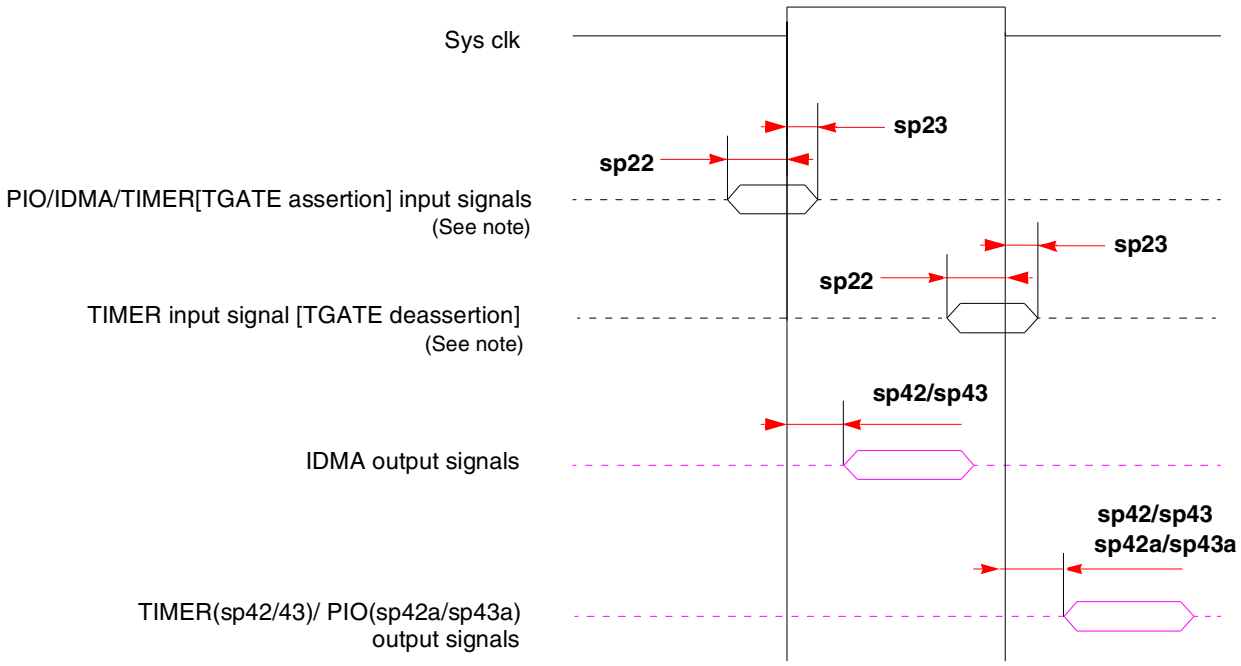
This figure shows TDM input and output signals.



Note: There are four possible TDM timing conditions:
1. Input sampled on the rising edge and output driven on the rising edge (shown).
2. Input sampled on the rising edge and output driven on the falling edge.
3. Input sampled on the falling edge and output driven on the falling edge.
4. Input sampled on the falling edge and output driven on the rising edge.

Figure 7. TDM Signal Diagram

This figure shows PIO and timer signals.



Note: TGATE is asserted on the rising edge of the clock; it is deasserted on the falling edge.

Figure 8. PIO and Timer Signal Diagram

6.2 SIU AC Characteristics

This table lists SIU input characteristics.

NOTE: CLKIN Jitter and Duty Cycle

The CLKIN input to the SoC should not exceed +/– 150 psec of jitter (peak-to-peak). This represents total input jitter—the combination of short term (peak-to-peak) and long term (cumulative). The duty cycle of CLKIN should not exceed the ratio of 40:60.

NOTE: Spread Spectrum Clocking

Spread spectrum clocking is allowed with 1% input frequency down-spread at maximum 60 KHz modulation rate regardless of input frequency.

NOTE: PCI AC Timing

The SoC meets the timing requirements of *PCI Specification Revision 2.2*. See Section 7, “Clock Configuration Modes,” and “Note: Tval (Output Hold)” to determine if a specific clock configuration is compliant.

This figure shows signal behavior in MEMC mode.

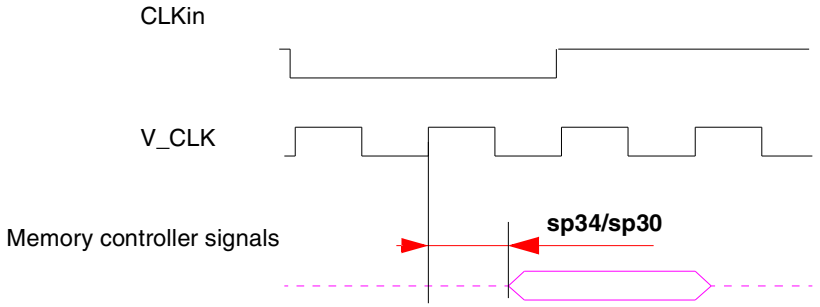


Figure 10. MEMC Mode Diagram

NOTE

Generally, all SoC bus and system output signals are driven from the rising edge of the input clock (CLKin). Memory controller signals, however, trigger on four points within a CLKin cycle. Each cycle is divided by four internal ticks: T1, T2, T3, and T4. T1 always occurs at the rising edge, and T3 at the falling edge, of CLKin. However, the spacing of T2 and T4 depends on the PLL clock ratio selected, as shown in Table 14.

Table 14. Tick Spacing for Memory Controller Signals

PLL Clock Ratio	Tick Spacing (T1 Occurs at the Rising Edge of CLKin)		
	T2	T3	T4
1:2, 1:3, 1:4, 1:5, 1:6	1/4 CLKin	1/2 CLKin	3/4 CLKin
1:2.5	3/10 CLKin	1/2 CLKin	8/10 CLKin
1:3.5	4/14 CLKin	1/2 CLKin	11/14 CLKin

This table is a representation of the information in Table 14.

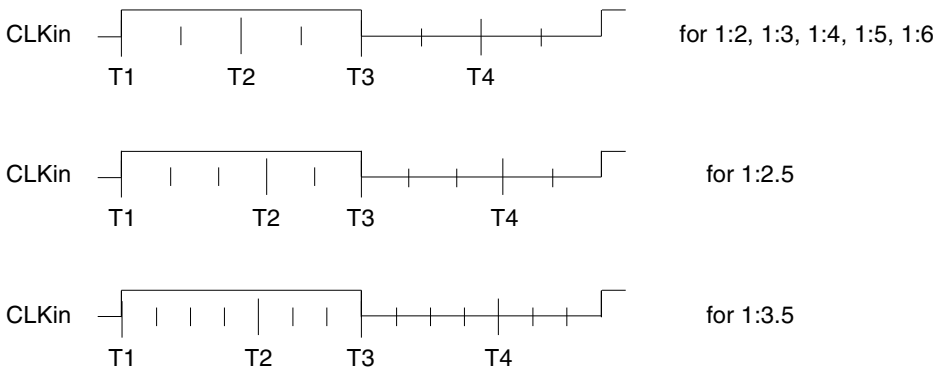

Figure 11. Internal Tick Spacing for Memory Controller Signals

7 Clock Configuration Modes

As shown in this table, the clocking mode is set according to two sources:

- PCI_CFG[0]— An input signal. Also defined as "$\overline{\text{PCI\_HOST\_EN}}$." See Chapter 6, "External Signals," and Chapter 9, "PCI Bridge," in the SoC reference manual.
- PCI_MODCK—Bit 27 in the Hard Reset Configuration Word. See Chapter 5, "Reset," in the SoC reference manual.

Table 16. SoC Clocking Modes

Pins		Clocking Mode	PCI Clock Frequency Range (MHz)	Reference
PCI_CFG[0][1]	PCI_MODCK[2]			
0	0	PCI host	50–66	Table 17
0	1		25–50	Table 18
1	0	PCI agent	50–66	Table 19
1	1		25–50	Table 20

1 PCI_HOST_EN
2 Determines PCI clock frequency range.

Within each mode, the configuration of bus, core, PCI, and CPM frequencies is determined by seven bits during the power-on reset—three hardware configuration pins (MODCK[1–3]) and four bits from hardware configuration word[28–31] (MODCK_H). Both the PLLs and the dividers are set according to the selected clock operation mode as described in the following sections.

NOTE

Clock configurations change only after $\overline{\text{PORESET}}$ is asserted.

NOTE: Tval (Output Hold)

The minimum Tval = 2 ns when PCI_MODCK = 1, and the minimum Tval = 1 ns when PCI_MODCK = 0. Therefore, designers should use clock configurations that fit this condition to achieve PCI-compliant AC timing.

7.1 PCI Host Mode

These tables show configurations for PCI host mode. The frequency values listed are for the purpose of illustration only. Users must select a mode and input bus frequency so that the resulting configuration does not exceed the frequency rating of the user's device. Note that in PCI host mode the input clock is the bus clock.

Note that PCI_MODCK is a bit in the Hard Reset Configuration Word. It is not an input signal as it is in the MPC8280 Family and MPC8260 Family. • Addition of "Note: Temperature Reflow for the VR Package" on page 56 • Table 21: Addition of note 2 to TRST (E21) and PORESET (C24) • Table 21: Removal of Thermal0 (D19) and Thermal1(J3). These pins are now "No connects." Note 4 unchanged. • Table 21: Removal of Spare0 (AD24). This pin is now a "No connect." Note 5 unchanged. • Table 21: Addition of PCI_MODE (AD22). This pin was previously listed as "Ground." Addition of note 1.
0.1	9/2003	• Addition of the MPC8271 and the MPC8247 (these devices do not have a security engine) • Table 8: Addition of note 2 to V_{IH} • Table 8: Changed I_{OL} for 60x signals to 6.0 mA • Modification of note 1 for Table 17, Table 18, Table 19, and Table 20 • Table 21: Addition of ball AD9 to GND. In rev 0 of this document, AD8 was listed as assigned to both CS5 and GND. AD8 is only assigned to CS5. • Table 21: Addition of note 4 to Thermal0 (D19) and Thermal1(J3) • Addition of ZQ package code to Figure 15
