

Welcome to E-XFL.COM

#### What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

#### Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

#### Details

E·XFI

Product Status	Active
Core Processor	dsPIC
Core Size	16-Bit
Speed	20 MIPS
Connectivity	I <sup>2</sup> C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	20
Program Memory Size	24KB (8K x 24)
Program Memory Type	FLASH
EEPROM Size	1K x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	2.5V ~ 5.5V
Data Converters	A/D 10x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	44-VQFN Exposed Pad
Supplier Device Package	44-QFN (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic30f3013-20e-ml

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

# 2.0 CPU ARCHITECTURE OVERVIEW

Note: This data sheet summarizes features of this group of dsPIC30F devices and is not intended to be a complete reference source. For more information on the CPU, peripherals, register descriptions and general device functionality, refer to the "dsPIC30F Family Reference Manual" (DS70046). For more information on the device instruction set and programming, refer to the "16-bit MCU and DSC Programmer's Reference Manual" (DS70157).

This section is an overview of the CPU architecture of the dsPIC30F. The core has a 24-bit instruction word. The Program Counter (PC) is 23 bits wide with the Least Significant bit (LSb) always clear (see **Section 3.1 "Program Address Space"**). The Most Significant bit (MSb) is ignored during normal program execution, except for certain specialized instructions. Thus, the PC can address up to 4M instruction words of user program space. An instruction prefetch mechanism helps maintain throughput. Program loop constructs, free from loop count management overhead, are supported using the DO and REPEAT instructions, both of which are interruptible at any point.

# 2.1 Core Overview

The working register array consists of 16 x 16-bit registers, each of which can act as data, address or offset registers. One working register (W15) operates as a Software Stack Pointer for interrupts and calls.

The data space is 64 Kbytes (32K words) and is split into two blocks, referred to as X and Y data memory. Each block has its own independent Address Generation Unit (AGU). Most instructions operate solely through the X memory, AGU, which provides the appearance of a single unified data space. The Multiply-Accumulate (MAC) class of dual source DSP instructions operate through both the X and Y AGUs, splitting the data address space into two parts (see **Section 3.2 "Data Address Space"**). The X and Y data space boundary is device specific and cannot be altered by the user. Each data word consists of 2 bytes and most instructions can address data either as words or bytes. Two ways to access data in program memory are:

- The upper 32 Kbytes of data space memory can be mapped into the lower half (user space) of program space at any 16K program word boundary, defined by the 8-bit Program Space Visibility Page register (PSVPAG). Thus any instruction can access program space as if it were data space, with a limitation that the access requires an additional cycle. Only the lower 16 bits of each instruction word can be accessed using this method.
- Linear indirect access of 32K word pages within program space is also possible using any working register, via table read and write instructions. Table read and write instructions can be used to access all 24 bits of an instruction word.

Overhead-free circular buffers (Modulo Addressing) are supported in both X and Y address spaces. This is primarily intended to remove the loop overhead for DSP algorithms.

The X AGU also supports Bit-Reversed Addressing on destination effective addresses to greatly simplify input or output data reordering for radix-2 FFT algorithms. Refer to **Section 4.0 "Address Generator Units"** for details on Modulo and Bit-Reversed Addressing.

The core supports Inherent (no operand), Relative, Literal, Memory Direct, Register Direct, Register Indirect, Register Offset and Literal Offset Addressing modes. Instructions are associated with pre-defined addressing modes, depending upon their functional requirements.

For most instructions, the core is capable of executing a data (or program data) memory read, a working register (data) read, a data memory write and a program (instruction) memory read per instruction cycle. As a result, 3 operand instructions are supported, allowing C = A+B operations to be executed in a single cycle.

A DSP engine has been included to significantly enhance the core arithmetic capability and throughput. It features a high-speed 17-bit by 17-bit multiplier, a 40-bit ALU, two 40-bit saturating accumulators and a 40-bit bidirectional barrel shifter. Data in the accumulator or any working register can be shifted up to 15 bits right, or 16 bits left in a single cycle. The DSP instructions operate seamlessly with all other instructions and have been designed for optimal real-time performance. The MAC class of instructions can concurrently fetch two data operands from memory while multiplying two W registers. To enable this concurrent fetching of data operands, the data space has been split for these instructions and linear is for all others. This has been achieved in a transparent and flexible manner, by dedicating certain working registers to each address space for the MAC class of instructions.

# 2.3 Divide Support

The dsPIC DSC devices feature a 16/16-bit signed fractional divide operation, as well as 32/16-bit and 16/16-bit signed and unsigned integer divide operations, in the form of single instruction iterative divides. The following instructions and data sizes are supported:

- 1. DIVF 16/16 signed fractional divide
- 2. DIV.sd 32/16 signed divide
- 3. DIV.ud 32/16 unsigned divide
- 4. DIV.s 16/16 signed divide
- 5. DIV.u 16/16 unsigned divide

The 16/16 divides are similar to the 32/16 (same number of iterations), but the dividend is either zero-extended or sign-extended during the first iteration.

The divide instructions must be executed within a REPEAT loop. Any other form of execution (e.g., a series of discrete divide instructions) will not function correctly because the instruction flow depends on RCOUNT. The divide instruction does not automatically set up the RCOUNT value and it must, therefore, be explicitly and correctly specified in the REPEAT instruction, as shown in Table 2-1 (REPEAT executes the target instruction {operand value+1} times). The REPEAT loop count must be setup for 18 iterations of the DIV/DIVF instruction. Thus, a complete divide operation requires 19 cycles.

**Note:** The divide flow is interruptible; however, the user needs to save the context as appropriate.

#### TABLE 2-1: DIVIDE INSTRUCTIONS

Instruction	Function
DIVF	Signed fractional divide: Wm/Wn $\rightarrow$ W0; Rem $\rightarrow$ W1
DIV.sd	Signed divide: (Wm+1:Wm)/Wn $\rightarrow$ W0; Rem $\rightarrow$ W1
DIV.s	Signed divide: Wm/Wn $\rightarrow$ W0; Rem $\rightarrow$ W1
DIV.ud	Unsigned divide: (Wm+1:Wm)/Wn $\rightarrow$ W0; Rem $\rightarrow$ W1
DIV.u	Unsigned divide: Wm/Wn $\rightarrow$ W0; Rem $\rightarrow$ W1

Legend: u = uninitialized bit; — = unimplemented bit, read as '0'

Note: Refer to the "dsPIC30F Family Reference Manual" (DS70046) for descriptions of register bit fields.

#### 7.0 **I/O PORTS**

Note: This data sheet summarizes features of this group of dsPIC30F devices and is not intended to be a complete reference source. For more information on the CPU. peripherals, register descriptions and general device functionality, refer to the "dsPIC30F Family Reference Manual" (DS70046).

All of the device pins (except VDD, Vss, MCLR and OSC1/CLKI) are shared between the peripherals and the parallel I/O ports.

All I/O input ports feature Schmitt Trigger inputs for improved noise immunity.

#### 7.1 Parallel I/O (PIO) Ports

When a peripheral is enabled and the peripheral is actively driving an associated pin, the use of the pin as a general purpose output pin is disabled. The I/O pin can be read, but the output driver for the parallel port bit is disabled. If a peripheral is enabled, but the peripheral is not actively driving a pin, that pin can be driven by a port.

All port pins have three registers directly associated with the operation of the port pin. The Data Direction register (TRISx) determines whether the pin is an input or an output. If the data direction bit is a '1', then the pin is an input. All port pins are defined as inputs after a Reset. Reads from the latch (LATx), read the latch. Writes to the latch, write the latch (LATx). Reads from the port (PORTx), read the port pins and writes to the port pins, write the latch (LATx).

Any bit and its associated data and Control registers that are not valid for a particular device are disabled. That means the corresponding LATx and TRISx registers and the port pin read as zeros.

When a pin is shared with another peripheral or function that is defined as an input only, it is nevertheless regarded as a dedicated port because there is no other competing source of outputs.

A parallel I/O (PIO) port that shares a pin with a peripheral is, in general, subservient to the peripheral. The peripheral's output buffer data and control signals are provided to a pair of multiplexers. The multiplexers select whether the peripheral or the associated port has ownership of the output data and control signals of the I/O pad cell. Figure 7-1 illustrates how ports are shared with other peripherals and the associated I/O cell (pad) to which they are connected.

The format of the registers for the shared ports, (PORTB, PORTC, PORTD and PORTF) are shown in Table 7-1 through Table 7-6.

Note: The actual bits in use vary between devices.

FIGURE 7-1: **BLOCK DIAGRAM OF A SHARED PORT STRUCTURE** 

# 8.6 Fast Context Saving

A context saving option is available using shadow registers. Shadow registers are provided for the DC, N, OV, Z and C bits in SR, and the registers W0 through W3. The shadows are only one level deep. The shadow registers are accessible using the PUSH.S and POP.S instructions only.

When the processor vectors to an interrupt, the PUSH.S instruction can be used to store the current value of the aforementioned registers into their respective shadow registers.

If an ISR of a certain priority uses the PUSH.S and POP.S instructions for fast context saving, then a higher priority ISR should not include the same instructions. Users must save the key registers in software during a lower priority interrupt if the higher priority ISR uses fast context saving.

# 8.7 External Interrupt Requests

The interrupt controller supports three external interrupt request signals, INT0-INT2. These inputs are edge sensitive; they require a low-to-high or a high-to-low transition to generate an interrupt request. The INTCON2 register has three bits, INT0EP-INT2EP, that select the polarity of the edge detection circuitry.

## 8.8 Wake-up from Sleep and Idle

The interrupt controller may be used to wake-up the processor from either Sleep or Idle modes, if Sleep or Idle mode is active when the interrupt is generated.

If an enabled interrupt request of sufficient priority is received by the interrupt controller, then the standard interrupt request is presented to the processor. At the same time, the processor wakes up from Sleep or Idle and begins execution of the ISR needed to process the interrupt request.

# 9.0 TIMER1 MODULE

Note: This data sheet summarizes features of this group of dsPIC30F devices and is not intended to be a complete reference source. For more information on the CPU, peripherals, register descriptions and general device functionality, refer to the "dsPIC30F Family Reference Manual" (DS70046).

This section describes the 16-bit general purpose Timer1 module and associated operational modes. Figure 9-1 depicts the simplified block diagram of the 16-bit Timer1 module. The following sections provide detailed descriptions including setup and Control registers, along with associated block diagrams for the operational modes of the timers.

The Timer1 module is a 16-bit timer that serves as the time counter for the real-time clock or operates as a free-running interval timer/counter. The 16-bit timer has the following modes:

- 16-bit Timer
- 16-bit Synchronous Counter
- 16-bit Asynchronous Counter

These operational characteristics are supported:

- Timer gate operation
- Selectable prescaler settings
- Timer operation during CPU Idle and Sleep modes
- Interrupt on 16-bit Period register match or falling edge of external gate signal

These operating modes are determined by setting the appropriate bit(s) in the 16-bit SFR, T1CON. Figure 9-1 presents a block diagram of the 16-bit timer module.

**16-bit Timer Mode:** In the 16-bit Timer mode, the timer increments on every instruction cycle up to a match value preloaded into the Period register PR1, then resets to '0' and continues to count.

When the CPU goes into the Idle mode, the timer stops incrementing unless the TSIDL (T1CON<13>) bit = 0. If TSIDL = 1, the timer module logic resumes the incrementing sequence on termination of CPU Idle mode.

**16-bit Synchronous Counter Mode:** In the 16-bit Synchronous Counter mode, the timer increments on the rising edge of the applied external clock signal which is synchronized with the internal phase clocks. The timer counts up to a match value preloaded in PR1, then resets to '0' and continues.

When the CPU goes into the Idle mode, the timer stops incrementing unless the respective TSIDL bit = 0. If TSIDL = 1, the timer module logic resumes the incrementing sequence upon termination of the CPU Idle mode.

**16-bit Asynchronous Counter Mode:** In the 16-bit Asynchronous Counter mode, the timer increments on every rising edge of the applied external clock signal. The timer counts up to a match value preloaded in PR1, then resets to '0' and continues.

When the timer is configured for the Asynchronous mode of operation and the CPU goes into the Idle mode, the timer stops incrementing if TSIDL = 1.

# 10.0 TIMER2/3 MODULE

Note: This data sheet summarizes features of this group of dsPIC30F devices and is not intended to be a complete reference source. For more information on the CPU, peripherals, register descriptions and general device functionality, refer to the "dsPIC30F Family Reference Manual "(DS70046).

This section describes the 32-bit general purpose Timer module (Timer2/3) and associated Operational modes. Figure 10-1 depicts the simplified block diagram of the 32-bit Timer2/3 module. Figure 10-2 and Figure 10-3 show Timer2/3 configured as two independent 16-bit timers, Timer2 and Timer3, respectively.

The Timer2/3 module is a 32-bit timer (which can be configured as two 16-bit timers) with selectable operating modes. These timers are utilized by other peripheral modules, such as:

- Input Capture
- Output Compare/Simple PWM

The following sections provide a detailed description, including setup and Control registers, along with associated block diagrams for the operational modes of the timers.

The 32-bit timer has the following modes:

- Two independent 16-bit timers (Timer2 and Timer3) with all 16-bit operating modes (except Asynchronous Counter mode)
- Single 32-bit timer operation
- Single 32-bit synchronous counter

Further, the following operational characteristics are supported:

- ADC event trigger
- Timer gate operation
- Selectable prescaler settings
- Timer operation during Idle and Sleep modes
- Interrupt on a 32-bit period register match

These operating modes are determined by setting the appropriate bit(s) in the 16-bit T2CON and T3CON SFRs.

For 32-bit timer/counter operation, Timer2 is the ls word and Timer3 is the ms word of the 32-bit timer.

Note:	For 32-bit timer operation, T3CON control
	bits are ignored. Only T2CON control bits
	are used for setup and control. Timer2
	clock and gate inputs are utilized for the
	32-bit timer module, but an interrupt is
	generated with the Timer3 interrupt flag
	(T3IF) and the interrupt is enabled with the
	Timer3 interrupt enable bit (T3IE).

**16-bit Timer Mode:** In the 16-bit mode, Timer2 and Timer3 can be configured as two independent 16-bit timers. Each timer can be set up in either 16-bit Timer mode or 16-bit Synchronous Counter mode. See **Section 9.0 "Timer1 Module"** for details on these two operating modes.

The only functional difference between Timer2 and Timer3 is that Timer2 provides synchronization of the clock prescaler output. This is useful for high frequency external clock inputs.

**32-bit Timer Mode:** In the 32-bit Timer mode, the timer increments on every instruction cycle, up to a match value preloaded into the combined 32-bit Period register PR3/PR2, then resets to '0' and continues to count.

For synchronous 32-bit reads of the Timer2/Timer3 pair, reading the Is word (TMR2 register) causes the ms word to be read and latched into a 16-bit holding register, termed TMR3HLD.

For synchronous 32-bit writes, the holding register (TMR3HLD) must first be written to. When followed by a write to the TMR2 register, the contents of TMR3HLD is transferred and latched into the MSB of the 32-bit timer (TMR3).

**32-bit Synchronous Counter Mode:** In the 32-bit Synchronous Counter mode, the timer increments on the rising edge of the applied external clock signal which is synchronized with the internal phase clocks. The timer counts up to a match value preloaded in the combined 32-bit period register, PR3/PR2, then resets to '0' and continues.

When the timer is configured for the Synchronous Counter mode of operation and the CPU goes into the Idle mode, the timer stops incrementing unless the TSIDL bit (T2CON<13>) = 0. If TSIDL = 1, the timer module logic resumes the incrementing sequence upon termination of the CPU Idle mode.

NOTES:

# 13.0 SPI<sup>™</sup> MODULE

Note: This data sheet summarizes features of this group of dsPIC30F devices and is not intended to be a complete reference source. For more information on the CPU, peripherals, register descriptions and general device functionality, refer to the "dsPIC30F Family Reference Manual" (DS70046).

The Serial Peripheral Interface (SPI<sup>™</sup>) module is a synchronous serial interface. It is useful for communicating with other peripheral devices, such as EEPROMs, shift registers, display drivers and A/D converters, or other microcontrollers. It is compatible with Motorola's SPI and SIOP interfaces. The dsPIC30F2011/2012/3012/3013 devices feature one SPI module, SPI1.

# 13.1 Operating Function Description

Figure 13-1 is a simplified block diagram of the SPI module, which consists of a 16-bit shift register, SPI1SR, used for shifting data in and out, and a buffer register, SPI1BUF. Control register SPI1CON (not shown) configures the module. Additionally, status register SPI1STAT (not shown) indicates various status conditions.

Note:	See	"dsP	IC301	= <i>I</i>	Famil	y R	Refere	nce
	Manu	al"	(DS7	0046	5)	for	deta	iled
	inform	nation	on t	the	contr	ol an	d sta	tus
	regist	ers.						

Four I/O pins comprise the serial interface:

- SDI1 (serial data input)
- SDO1 (serial data output)
- SCK1 (shift clock input or output)
- SS1 (active-low slave select).

In Master mode operation, SCK1 is a clock output. In Slave mode, it is a clock input.

A series of eight (8) or sixteen (16) clock pulses shift out bits from the SPI1SR to SDO1 pin and simultaneously shift in data from SDI1 pin. An interrupt is generated when the transfer is complete and the interrupt flag bit (SPI1IF) is set. This interrupt can be disabled through the interrupt enable bit, SPI1IE.

The receive operation is double-buffered. When a complete byte is received, it is transferred from SPI1SR to SPI1BUF.

If the receive buffer is full when new data is being transferred from SPI1SR to SPI1BUF, the module will set the SPIROV bit indicating an overflow condition. The transfer of the data from SPI1SR to SPI1BUF is not completed and the new data is lost. The module will not respond to SCL transitions while SPIROV is '1', effectively disabling the module until SPI1BUF is read by user software.

Transmit writes are also double-buffered. The user writes to SPI1BUF. When the master or slave transfer is completed, the contents of the shift register (SPI1SR) are moved to the receive buffer. If any transmit data has been written to the buffer register, the contents of the transmit buffer are moved to SPI1SR. The received data is thus placed in SPI1BUF and the transmit data in SPI1SR is ready for the next transfer.

Note: Both the transmit buffer (SPI1TXB) and the receive buffer (SPI1RXB) are mapped to the same register address, SPI1BUF.

HS/2 w/PLL 4x	10 MHz-20 MHz crystal, divide by 2, 4x PLL enabled.
HS/2 w/PLL 8x	10 MHz-20 MHz crystal, divide by 2, 8x PLL enabled.
HS/2 w/PLL 16x	10 MHz-15 MHz crystal, divide by 2, 16x PLL enabled <sup>(1)</sup> .
HS/3 w/PLL 4x	12 MHz-25 MHz crystal, divide by 3, 4x PLL enabled.
HS/3 w/PLL 8x	12 MHz-25 MHz crystal, divide by 3, 8x PLL enabled.
HS/3 w/PLL 16x	12 MHz-22.5 MHz crystal, divide by 3, 16x PLL enabled <sup>(1)</sup> .
EC	External clock input (0-40 MHz).
ECIO	External clock input (0-40 MHz), OSC2 pin is I/O.
EC w/PLL 4x	External clock input (4-10 MHz), OSC2 pin is I/O, 4x PLL enabled.
EC w/PLL 8x	External clock input (4-10 MHz), OSC2 pin is I/O, 8x PLL enabled.
EC w/PLL 16x	External clock input (4-7.5 MHz), OSC2 pin is I/O, 16x PLL enabled <sup>(1)</sup> .
ERC	External RC oscillator, OSC2 pin is Fosc/4 output <sup>(3)</sup> .
ERCIO	External RC oscillator, OSC2 pin is I/O <sup>(3)</sup> .
FRC	7.37 MHz internal RC oscillator.
FRC w/PLL 4x	7.37 MHz Internal RC oscillator, 4x PLL enabled.
FRC w/PLL 8x	7.37 MHz Internal RC oscillator, 8x PLL enabled.
FRC w/PLL 16x	7.37 MHz Internal RC oscillator, 16x PLL enabled.
LPRC	512 kHz internal RC oscillator.

**Note 1:** dsPIC30F maximum operating frequency of 120 MHz must be met.

2: LP oscillator can be conveniently shared as system clock, as well as real-time clock for Timer1.

3: Requires external R and C. Frequency operation up to 4 MHz.

# 17.4 Watchdog Timer (WDT)

### 17.4.1 WATCHDOG TIMER OPERATION

The primary function of the Watchdog Timer (WDT) is to reset the processor in the event of a software malfunction. The WDT is a free-running timer which runs off an on-chip RC oscillator, requiring no external component. Therefore, the WDT timer will continue to operate even if the main processor clock (e.g., the crystal oscillator) fails.

#### 17.4.2 ENABLING AND DISABLING THE WDT

The Watchdog Timer can be "Enabled" or "Disabled" only through a Configuration bit (FWDTEN) in the Configuration register, FWDT.

Setting FWDTEN = 1 enables the Watchdog Timer. The enabling is done when programming the device. By default, after chip erase, FWDTEN bit = 1. Any device programmer capable of programming dsPIC30F devices allows programming of this and other Configuration bits.

If enabled, the WDT will increment until it overflows or "times out". A WDT time-out will force a device Reset (except during Sleep). To prevent a WDT time-out, the user must clear the Watchdog Timer using a CLRWDT instruction.

If a WDT times out during Sleep, the device will wake-up. The WDTO bit in the RCON register will be cleared to indicate a wake-up resulting from a WDT time-out.

Setting FWDTEN = 0 allows user software to enable/disable the Watchdog Timer via the SWDTEN (RCON<5>) control bit.

# 17.5 Low-Voltage Detect

The Low-Voltage Detect (LVD) module is used to detect when the VDD of the device drops below a threshold value, VLVD, which is determined by the LVDL<3:0> bits (RCON<11:8>) and is thus user programmable. The internal voltage reference circuitry requires a nominal amount of time to stabilize, and the BGST bit (RCON<13>) indicates when the voltage reference has stabilized.

In some devices, the LVD threshold voltage may be applied externally on the LVDIN pin.

The LVD module is enabled by setting the LVDEN bit (RCON<12>).

## 17.6 Power-Saving Modes

There are two power-saving states that can be entered through the execution of a special instruction, PWRSAV; these are Sleep and Idle.

The format of the PWRSAV instruction is as follows:

PWRSAV <parameter>, where 'parameter' defines Idle or Sleep mode.

### 17.6.1 SLEEP MODE

In Sleep mode, the clock to the CPU and peripherals is shut down. If an on-chip oscillator is being used, it is shut down.

The Fail-Safe Clock Monitor is not functional during Sleep since there is no clock to monitor. However, LPRC clock remains active if WDT is operational during Sleep.

The brown-out protection circuit and the Low-Voltage Detect circuit, if enabled, will remain functional during Sleep.

The processor wakes up from Sleep if at least one of the following conditions has occurred:

- any interrupt that is individually enabled and meets the required priority level
- any Reset (POR, BOR and MCLR)
- WDT time-out

On waking up from Sleep mode, the processor will restart the same clock that was active prior to entry into Sleep mode. When clock switching is enabled, bits COSC<2:0> will determine the oscillator source that will be used on wake-up. If clock switch is disabled, then there is only one system clock.

Note: If a POR or BOR occurred, the selection of the oscillator is based on the FOS<2:0> and FPR<4:0> Configuration bits.

If the clock source is an oscillator, the clock to the device will be held off until OST times out (indicating a stable oscillator). If PLL is used, the system clock is held off until LOCK = 1 (indicating that the PLL is stable). In either case, TPOR, TLOCK and TPWRT delays are applied.

If EC, FRC, LPRC or ERC oscillators are used, then a delay of TPOR (~ 10  $\mu$ s) is applied. This is the smallest delay possible on wake-up from Sleep.

Moreover, if LP oscillator was active during Sleep and LP is the oscillator used on wake-up, then the start-up delay will be equal to TPOR. PWRT delay and OST timer delay are not applied. In order to have the smallest possible start-up delay when waking up from Sleep, one of these faster wake-up options should be selected before entering Sleep.

All instructions are a single word, except for certain double-word instructions, which were made double-word instructions so that all the required information is available in these 48 bits. In the second word, the 8 MSbs are '0's. If this second word is executed as an instruction (by itself), it will execute as a NOP.

Most single-word instructions are executed in a single instruction cycle, unless a conditional test is true or the program counter is changed as a result of the instruction. In these cases, the execution takes two instruction cycles with the additional instruction cycle(s) executed as a NOP. Notable exceptions are the BRA (unconditional/computed branch), indirect CALL/GOTO, all table reads and writes, and RETURN/RETFIE instructions, which are single-word instructions but take two or three cycles. Certain instructions that involve skipping over the subsequent instruction require either two or three cycles if the skip is performed, depending on whether the instruction being skipped is a single-word or two-word instruction. Moreover, double-word moves require two cycles. The double-word instructions execute in two instruction cycles.

**Note:** For more details on the instruction set, refer to the *"MCU and DSC Programmer's Reference Manual"* (DS70157).

Field	Description
#text	Means literal defined by "text"
(text)	Means "content of text"
[text]	Means "the location addressed by text"
{ }	Optional field or operation
<n:m></n:m>	Register bit field
.b	Byte mode selection
.d	Double-Word mode selection
.S	Shadow register select
.w	Word mode selection (default)
Acc	One of two accumulators {A, B}
AWB	Accumulator write-back destination address register ∈ {W13, [W13]+=2}
bit4	4-bit bit selection field (used in word addressed instructions) $\in \{015\}$
C, DC, N, OV, Z	MCU Status bits: Carry, Digit Carry, Negative, Overflow, Sticky Zero
Expr	Absolute address, label or expression (resolved by the linker)
f	File register address ∈ {0x00000x1FFF}
lit1	1-bit unsigned literal $\in \{0,1\}$
lit4	4-bit unsigned literal $\in \{015\}$
lit5	5-bit unsigned literal $\in \{031\}$
lit8	8-bit unsigned literal ∈ {0255}
lit10	10-bit unsigned literal $\in \{0255\}$ for Byte mode, $\{0:1023\}$ for Word mode
lit14	14-bit unsigned literal $\in \{016384\}$
lit16	16-bit unsigned literal $\in \{065535\}$
lit23	23-bit unsigned literal $\in$ {08388608}; LSB must be 0
None	Field does not require an entry, may be blank
OA, OB, SA, SB	DSP Status bits: ACCA Overflow, ACCB Overflow, ACCA Saturate, ACCB Saturate
PC	Program Counter
Slit10	10-bit signed literal ∈ {-512511}
Slit16	16-bit signed literal ∈ {-3276832767}
Slit6	6-bit signed literal ∈ {-1616}

TABLE 18-1:	SYMBOLS USED IN OPCODE DESCRIPTIONS

DC CHA	ARACTER	Standard Operating Conditions: 2.5V to 5.5V   (unless otherwise stated)   Operating temperature -40°C ≤TA ≤+85°C for Industrial   -40°C ≤TA ≤+125°C for Extended					
Param No.	Symbol	Characteristic	Min	Typ <sup>(1)</sup>	Max	Units	Conditions

are not tested.2: These parameters are characterized but not tested in manufacturing.

# 21.0 PACKAGING INFORMATION

# 21.1 Package Marking Information

#### 28-Lead SPDIP

#### Example

Example

Legend	: XXX Y YY WW NNN @3 *	Customer-specific information Year code (last digit of calendar year) Year code (last 2 digits of calendar year) Week code (week of January 1 is week '01') Alphanumeric traceability code Pb-free JEDEC designator for Matte Tin (Sn) This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.		
Note:	In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.			

# APPENDIX A: REVISION HISTORY

# **Revision D (August 2006)**

Previous versions of this data sheet contained Advance or Preliminary Information. They were distributed with incomplete characterization data.

This revision reflects these updates:

- Supported I<sup>2</sup>C Slave Addresses (see Table 14-1)
- ADC Conversion Clock selection to allow 200 kHz sampling rate (see Section 16.0 "12-bit Analog-to-Digital Converter (ADC) Module")
- Operating Current (IDD) Specifications (see Table 20-5)
- Idle Current (IIDLE) Specifications (see Table 20-6)
- Power-Down Current (IPD) Specifications (see Table 20-7)
- I/O pin Input Specifications (see Table 20-8)
- BOR voltage limits (see Table 20-11)
- Watchdog Timer time-out limits (see Table 20-21)

# **Revision E (December 2006)**

This revision includes updates to the packaging diagrams.

# Revision F (May 2008)

This revision reflects these updates:

- Added FUSE Configuration Register (FICD) details (see Section 17.7 "Device Configuration Registers" and Table 17-8)
- Added Note 2 to Device Configuration Registers table (Table 17-8)
- Updated Bit 10 in the UART2 Register Map (see Table 15-2). This bit is unimplemented.
- Electrical Specifications:
  - Resolved TBD values for parameters DO10, DO16, DO20, and DO26 (see Table 20-9)
  - 10-bit High-Speed ADC tPDU timing parameter (time to stabilize) has been updated from 20 µs typical to 20 µs maximum (see Table 20-37)
  - Parameter OS65 (Internal RC Accuracy) has been expanded to reflect multiple Min and Max values for different temperatures (see Table 20-19)
  - Parameter DC12 (RAM Data Retention Voltage) has been updated to include a Min value (see Table 20-4)
  - Parameter D134 (Erase/Write Cycle Time) has been updated to include Min and Max values and the Typ value has been removed (see Table 20-12)
  - Removed parameters OS62 (Internal FRC Jitter) and OS64 (Internal FRC Drift) and Note 2 from AC Characteristics (see Table 20-18)
  - Parameter OS63 (Internal FRC Accuracy) has been expanded to reflect multiple Min and Max values for different temperatures (see Table 20-18)
  - Updated Min and Max values and Conditions for parameter SY11 and updated Min, Typ, and Max values and Conditions for parameter SY20 (see Table 20-21)
- Additional minor corrections throughout the document
