
What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	XCore
Core Size	32-Bit 6-Core
Speed	500MIPS
Connectivity	Configurable
Peripherals	-
Number of I/O	28
Program Memory Size	64KB (16K x 32)
Program Memory Type	SRAM
EEPROM Size	-
RAM Size	-
Voltage - Supply (Vcc/Vdd)	0.95V ~ 3.6V
Data Converters	-
Oscillator Type	External
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	48-TQFP Exposed Pad
Supplier Device Package	48-TQFP (7x7)
Purchase URL	https://www.e-xfl.com/product-detail/xmos/xs1-l6a-64-tq48-c5

OD, F and R must be chosen so that $0 \le R \le 63$, $0 \le F \le 4095$, $0 \le OD \le 7$, and $260MHz \le F_{osc} \times \frac{F+1}{2} \times \frac{1}{R+1} \le 1.3GHz$. The OD, F, and R values can be modified by writing to the digital node PLL configuration register.

The MODE pins must be held at a static value during and after deassertion of the system reset.

If a different tile frequency is required (eg, 500 MHz), then the PLL must be reprogrammed after boot to provide the required tile frequency. The XMOS tools perform this operation by default. Further details on configuring the clock can be found in the XS1-L Clock Frequency Control document, X1433.

7 Boot Procedure

The device is kept in reset by driving RST_N low. When in reset, all GPIO pins are high impedance. When the device is taken out of reset by releasing RST_N the processor starts its internal reset process. After 15-150 μs (depending on the input clock), all GPIO pins have their internal pull-resistor enabled, and the processor boots at a clock speed that depends on MODE0 and MODE1.

The xCORE Tile boot procedure is illustrated in Figure 7. In normal usage, MODE[3:2] controls the boot source according to the table in Figure 8. If bit 5 of the security register (*see* §8.1) is set, the device boots from OTP.

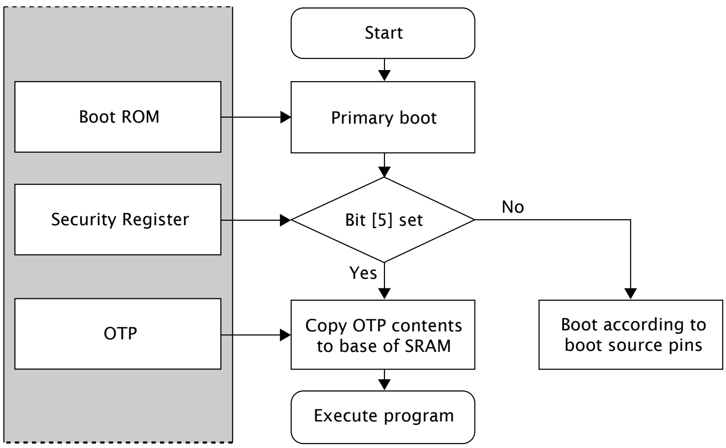

Figure 7: Boot procedure

MODE[3]	MODE[2]	Boot Source
0	0	None: Device waits to be booted via JTAG
0	1	Reserved
1	0	xConnect Link B
1	1	SPI

Figure 8: Boot source pins

The boot image has the following format:

Several pins of each type are provided to minimize the effect of inductance within the package, all of which must be connected. The power supplies must be brought up monotonically and input voltages must not exceed specification at any time.

The VDD supply must ramp from 0 V to its final value within 10 ms to ensure correct startup.

The VDDIO supply must ramp to its final value before VDD reaches 0.4 V.

The PLL_AVDD supply should be separated from the other noisier supplies on the board. The PLL requires a very clean power supply, and a low pass filter (for example, a 4.7 Ω resistor and 100 nF multi-layer ceramic capacitor) is recommended on this pin.

The following ground pins are provided:

- GND for all supplies

All ground pins must be connected directly to the board ground.

The VDD and VDDIO supplies should be decoupled close to the chip by several 100 nF low inductance multi-layer ceramic capacitors between the supplies and GND (for example, 4x100nF 0402 low inductance MLCCs per supply rail). The ground side of the decoupling capacitors should have as short a path back to the GND pins as possible. A bulk decoupling capacitor of at least 10 uF should be placed on each of these supplies.

RST_N is an active-low asynchronous-assertion global reset signal. Following a reset, the PLL re-establishes lock after which the device boots up according to the boot mode (*see* §7). RST_N and must be asserted low during and after power up for 100 ns.

10.1 Land patterns and solder stencils

The land pattern recommendations in this document are based on a RoHS compliant process and derived, where possible, from the nominal *Generic Requirements for Surface Mount Design and Land Pattern Standards* IPC-7351B specifications. This standard aims to achieve desired targets of heel, toe and side fillets for solder-joints.

Solder paste and ground via recommendations are based on our engineering and development kit board production. They have been found to work and optimized as appropriate to achieve a high yield. The size, type and number of vias used in the center pad affects how much solder wicks down the vias during reflow. This in turn, along with solder paster coverage, affects the final assembled package height. These factors should be taken into account during design and manufacturing of the PCB.

The following land patterns and solder paste contains recommendations. Final land pattern and solder paste decisions are the responsibility of the customer. These should be tuned during manufacture to suit the manufacturing process.

The package is a 48 pin Thin Quad Flat Pack package with exposed heat slug on a 0.5mm pitch. An example land pattern is shown in Figure 14.

For the 48 pin TQFP package, a single square of solder paste, 2.7mm on a side, is recommended - see Figure 15. This gives a paste level of 52%.

10.2 Ground and Thermal Vias

Vias under the heat slug into the ground plane of the PCB are recommended for a low inductance ground connection and good thermal performance. A 3 x 3 grid of vias, with a 0.6mm diameter annular ring and a 0.3mm drill, equally spaced across the heat slug, would be suitable.

10.3 Moisture Sensitivity

XMOS devices are, like all semiconductor devices, susceptible to moisture absorption. When removed from the sealed packaging, the devices slowly absorb moisture from the surrounding environment. If the level of moisture present in the device is too high during reflow, damage can occur due to the increased internal vapour pressure of moisture. Example damage can include bond wire damage, die lifting, internal or external package cracks and/or delamination.

All XMOS devices are Moisture Sensitivity Level (MSL) 3 - devices have a shelf life of 168 hours between removal from the packaging and reflow, provided they are stored below 30C and 60% RH. If devices have exceeded these values or an included moisture indicator card shows excessive levels of moisture, then the parts should be baked as appropriate before use. This is based on information from *Joint IPC/JEDEC Standard For Moisture/Reflow Sensitivity Classification For Nonhermetic Solid State Surface-Mount Devices* J-STD-020 Revision D.

11 DC and Switching Characteristics

11.1 Operating Conditions

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
VDD	Tile DC supply voltage	0.95	1.00	1.05	V	
VDDIO	I/O supply voltage	3.00	3.30	3.60	V	
PLL_AVDD	PLL analog supply	0.95	1.00	1.05	V	
Cl	xCORE Tile I/O load capacitance			25	pF	
Ta	Ambient operating temperature	0		70	°C	
Ta	Ambient operating temperature	-40		85	°C	
Tj	Junction temperature			125	°C	
Tstg	Storage temperature	-65		150	°C	

Figure 16: Operating conditions

11.2 DC Characteristics

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
V(IH)	Input high voltage	2.00		3.60	V	A
V(IL)	Input low voltage	-0.30		0.70	V	A
V(OH)	Output high voltage	2.00			V	B, C
V(OL)	Output low voltage			0.60	V	B, C
R(PU)	Pull-up resistance		35K		Ω	D
R(PD)	Pull-down resistance		35K		Ω	D

A All pins except power supply pins.

B Ports 1A, 1D, 1E, 1H, 1I, 1J, 1K and 1L are nominal 8 mA drivers, the remainder of the general-purpose I/Os are 4 mA.

C Measured with 4 mA drivers sourcing 4 mA, 8 mA drivers sourcing 8 mA.

D Used to guarantee logic state for an I/O when high impedance. The internal pull-ups/pull-downs should not be used to pull external circuitry.

Figure 17: DC characteristics

11.3 ESD Stress Voltage

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
HBM	Human body model	-2.00		2.00	KV	
MM	Machine model	-200		200	V	

Figure 18: ESD stress voltage

11.6 Clock

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
f	Frequency	4.22	20	100	MHz	
SR	Slew rate	0.10			V/ns	
TJ(LT)	Long term jitter (pk-pk)			2	%	A
f(MAX)	Processor clock frequency (Speed Grade 4)			400	MHz	B
	Processor clock frequency (Speed Grade 5)			500	MHz	B

Figure 21: Clock

A Percentage of CLK period.

B Assumes typical tile and I/O voltages with nominal activity.

Further details can be found in the XS1-L Clock Frequency Control document, X1433.

11.7 xCORE Tile I/O AC Characteristics

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
T(XOVALID)	Input data valid window	8			ns	
T(XOINVALID)	Output data invalid window	9			ns	
T(XIFMAX)	Rate at which data can be sampled with respect to an external clock			60	MHz	

Figure 22: I/O AC characteristics

The input valid window parameter relates to the capability of the device to capture data input to the chip with respect to an external clock source. It is calculated as the sum of the input setup time and input hold time with respect to the external clock as measured at the pins. The output invalid window specifies the time for which an output is invalid with respect to the external clock. Note that these parameters are specified as a window rather than absolute numbers since the device provides functionality to delay the incoming clock with respect to the incoming data.

Information on interfacing to high-speed synchronous interfaces can be found in the XS1 Port I/O Timing document, X5821.

11.8 xConnect Link Performance

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
B(2blinkP)	2b link bandwidth (packetized)			87	MBit/s	A, B
B(5blinkP)	5b link bandwidth (packetized)			217	MBit/s	A, B
B(2blinkS)	2b link bandwidth (streaming)			100	MBit/s	B
B(5blinkS)	5b link bandwidth (streaming)			250	MBit/s	B

Figure 23: Link performance

A Assumes 32-byte packet in 3-byte header mode. Actual performance depends on size of the header and payload.

B 7.5 ns symbol time.

12.1 Part Marking

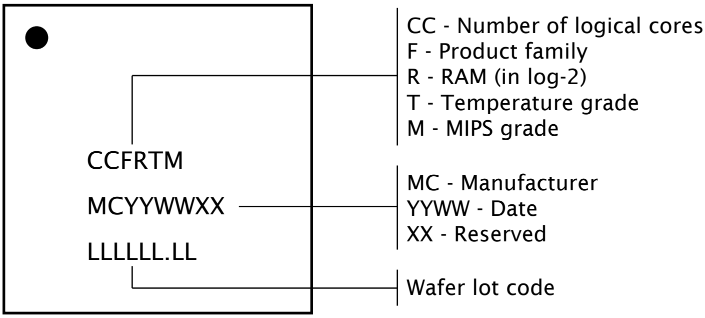

Figure 25: Part marking scheme

13 Ordering Information

Product Code	Marking	Qualification	Speed Grade
XS1-L6A-64-TQ48-C4	6L6C4	Commercial	400 MIPS
XS1-L6A-64-TQ48-C5	6L6C5	Commercial	500 MIPS
XS1-L6A-64-TQ48-I4	6L6I4	Industrial	400 MIPS
XS1-L6A-64-TQ48-I5	6L6I5	Industrial	500 MIPS

Figure 26: Orderable part numbers

Appendices

A Configuration of the XS1

The device is configured through three banks of registers, as shown in Figure 27.

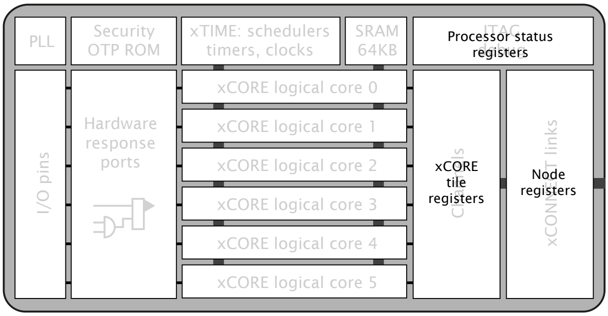

Figure 27: Registers

The following communication sequences specify how to access those registers. Any messages transmitted contain the most significant 24 bits of the channel-end to which a response is to be sent. This comprises the node-identifier and the channel number within the node. if no response is required on a write operation, supply 24-bits with the last 8-bits set, which suppresses the reply message. Any multi-byte data is sent most significant byte first.

A.1 Accessing a processor status register

The processor status registers are accessed directly from the processor instruction set. The instructions GETPS and SETPS read and write a word. The register number should be translated into a processor-status resource identifier by shifting the register number left 8 places, and ORing it with 0x0C. Alternatively, the functions `getps(reg)` and `setps(reg,value)` can be used from XC.

A.2 Accessing an xCORE Tile configuration register

xCORE Tile configuration registers can be accessed through the interconnect using the functions `write_tile_config_reg(tileref, ...)` and `read_tile_config_reg(tile ↪ ref, ...)`, where `tileref` is the name of the xCORE Tile, e.g. `tile[1]`. These functions implement the protocols described below.

Instead of using the functions above, a channel-end can be allocated to communicate with the xCORE tile configuration registers. The destination of the channel-end should be set to `0xnnnnC20C` where `nnnnnn` is the tile-identifier.

A write message comprises the following:

control-token 192	24-bit response channel-end identifier	16-bit register number	32-bit data	control-token 1

The response to a write message comprises either control tokens 3 and 1 (for success), or control tokens 4 and 1 (for failure).

A read message comprises the following:

control-token 193	24-bit response channel-end identifier	16-bit register number	control-token 1

The response to the read message comprises either control token 3, 32-bit of data, and control-token 1 (for success), or control tokens 4 and 1 (for failure).

A.3 Accessing node configuration

Node configuration registers can be accessed through the interconnect using the functions `write_node_config_reg(device, ...)` and `read_node_config_reg(device, ↪ ...)`, where `device` is the name of the node. These functions implement the protocols described below.

Instead of using the functions above, a channel-end can be allocated to communicate with the node configuration registers. The destination of the channel-end should be set to `0xnnnnC30C` where `nnnn` is the node-identifier.

A write message comprises the following:

control-token 192	24-bit response channel-end identifier	16-bit register number	32-bit data	control-token 1

The response to a write message comprises either control tokens 3 and 1 (for success), or control tokens 4 and 1 (for failure).

A read message comprises the following:

control-token 193	24-bit response channel-end identifier	16-bit register number	control-token 1

The response to a read message comprises either control token 3, 32-bit of data, and control-token 1 (for success), or control tokens 4 and 1 (for failure).

0x03: xCORE Tile boot status

Bits	Perm	Init	Description
31:24	RO	-	Reserved
23:16	RO		xCORE tile number on the switch.
15:9	RO	-	Reserved
8	RO		Set to 1 if boot from OTP is enabled.
7:0	RO		The boot mode pins MODE0, MODE1, ..., specifying the boot frequency, boot source, etc.

B.5 Security configuration: 0x05

Copy of the security register as read from OTP.

0x05: Security configuration

Bits	Perm	Init	Description
31:0	RO		Value.

B.6 Ring Oscillator Control: 0x06

There are four free-running oscillators that clock four counters. The oscillators can be started and stopped using this register. The counters should only be read when the ring oscillator is stopped. The counter values can be read using four subsequent registers. The ring oscillators are asynchronous to the xCORE tile clock and can be used as a source of random bits.

0x06: Ring Oscillator Control

Bits	Perm	Init	Description
31:2	RO	-	Reserved
1	RW	0	Set to 1 to enable the xCORE tile ring oscillators
0	RW	0	Set to 1 to enable the peripheral ring oscillators

B.7 Ring Oscillator Value: 0x07

This register contains the current count of the xCORE Tile Cell ring oscillator. This value is not reset on a system reset.

0x07: Ring Oscillator Value

Bits	Perm	Init	Description
31:16	RO	-	Reserved
15:0	RO	-	Ring oscillator counter data.

0x11: Debug SPC

Bits	Perm	Init	Description
31:0	DRW		Value.

B.13 Debug SSP: 0x12

This register contains the value of the SSP register when the debugger was called.

0x12: Debug SSP

Bits	Perm	Init	Description
31:0	DRW		Value.

B.14 DGETREG operand 1: 0x13

The resource ID of the logical core whose state is to be read.

0x13: DGETREG operand 1

Bits	Perm	Init	Description
31:8	RO	-	Reserved
7:0	DRW		Thread number to be read

B.15 DGETREG operand 2: 0x14

Register number to be read by DGETREG

0x14: DGETREG operand 2

Bits	Perm	Init	Description
31:5	RO	-	Reserved
4:0	DRW		Register number to be read

B.16 Debug interrupt type: 0x15

Register that specifies what activated the debug interrupt.

0x50 .. 0x53: Data watchpoint address 1

Bits	Perm	Init	Description
31:0	DRW		Value.

B.23 Data watchpoint address 2: 0x60 .. 0x63

This set of registers contains the second address for the four data watchpoints.

0x60 .. 0x63: Data watchpoint address 2

Bits	Perm	Init	Description
31:0	DRW		Value.

B.24 Data breakpoint control register: 0x70 .. 0x73

This set of registers controls each of the four data watchpoints.

0x70 .. 0x73: Data breakpoint control register

Bits	Perm	Init	Description
31:24	RO	-	Reserved
23:16	DRW	0	A bit for each logical core in the tile allowing the breakpoint to be enabled individually for each logical core.
15:3	RO	-	Reserved
2	DRW	0	Set to 1 to enable breakpoints to be triggered on loads. Breakpoints always trigger on stores.
1	DRW	0	By default, data watchpoints trigger if memory in the range [Address1..Address2] is accessed (the range is inclusive of Address1 and Address2). If set to 1, data watchpoints trigger if memory outside the range (Address2..Address1) is accessed (the range is exclusive of Address2 and Address1).
0	DRW	0	When 1 the instruction breakpoint is enabled.

B.25 Resources breakpoint mask: 0x80 .. 0x83

This set of registers contains the mask for the four resource watchpoints.

0x04: Control PSwitch permissions to debug registers

Bits	Perm	Init	Description
31:1	RO	-	Reserved
0	CRW		Set to 1 to restrict PSwitch access to all CRW marked registers to become read-only rather than read-write.

C.5 Cause debug interrupts: 0x05

This register can be used to raise a debug interrupt in this xCORE tile.

0x05: Cause debug interrupts

Bits	Perm	Init	Description
31:2	RO	-	Reserved
1	RO	0	Set to 1 when the processor is in debug mode.
0	CRW	0	Set to 1 to request a debug interrupt on the processor.

C.6 xCORE Tile clock divider: 0x06

This register contains the value used to divide the PLL clock to create the xCORE tile clock. The divider is enabled under control of the tile control register

0x06: xCORE Tile clock divider

Bits	Perm	Init	Description
31:8	RO	-	Reserved
7:0	RW		Value of the clock divider minus one.

C.7 Security configuration: 0x07

Copy of the security register as read from OTP.

0x07: Security configuration

Bits	Perm	Init	Description
31:0	RO		Value.

C.8 PLink status: 0x10 .. 0x13

Status of each of the four processor links; connecting the xCORE tile to the switch.

0x10 .. 0x13: PLink status

Bits	Perm	Init	Description
31:26	RO	-	Reserved
25:24	RO		00 - ChannelEnd, 01 - ERROR, 10 - PSCTL, 11 - Idle.
23:16	RO		Based on SRC_TARGET_TYPE value, it represents channelEnd ID or Idle status.
15:6	RO	-	Reserved
5:4	RO		Two-bit network identifier
3	RO	-	Reserved
2	RO		1 when the current packet is considered junk and will be thrown away.
1	RO	0	Set to 1 if the switch is routing data into the link, and if a route exists from another link.
0	RO	0	Set to 1 if the link is routing data into the switch, and if a route is created to another link on the switch.

C.9 Debug scratch: 0x20 .. 0x27

A set of registers used by the debug ROM to communicate with an external debugger, for example over the switch. This is the same set of registers as the Debug Scratch registers in the processor status.

0x20 .. 0x27: Debug scratch

Bits	Perm	Init	Description
31:0	CRW		Value.

C.10 PC of logical core 0: 0x40

Value of the PC of logical core 0.

0x40: PC of logical core 0

Bits	Perm	Init	Description
31:0	RO		Value.

C.11 PC of logical core 1: 0x41

0x41: PC of logical core 1

Bits	Perm	Init	Description
31:0	RO		Value.

C.12 PC of logical core 2: 0x42

0x42: PC of logical core 2

Bits	Perm	Init	Description
31:0	RO		Value.

C.13 PC of logical core 3: 0x43

0x43: PC of logical core 3

Bits	Perm	Init	Description
31:0	RO		Value.

C.14 PC of logical core 4: 0x44

0x44: PC of logical core 4

Bits	Perm	Init	Description
31:0	RO		Value.

C.15 PC of logical core 5: 0x45

0x45: PC of logical core 5

Bits	Perm	Init	Description
31:0	RO		Value.

C.16 SR of logical core 0: 0x60

Value of the SR of logical core 0

D Node Configuration

The digital node control registers can be accessed using configuration reads and writes (use `write_node_config_reg(device, ...)` and `read_node_config_reg(device, ↪ ...)` for reads and writes).

Number	Perm	Description
0x00	RO	Device identification
0x01	RO	System switch description
0x04	RW	Switch configuration
0x05	RW	Switch node identifier
0x06	RW	PLL settings
0x07	RW	System switch clock divider
0x08	RW	Reference clock
0x0C	RW	Directions 0-7
0x0D	RW	Directions 8-15
0x10	RW	DEBUG_N configuration
0x1F	RO	Debug source
0x20 .. 0x27	RW	Link status, direction, and network
0x40 .. 0x43	RW	PLink status and network
0x80 .. 0x87	RW	Link configuration and initialization
0xA0 .. 0xA7	RW	Static link configuration

Figure 30: Summary

D.1 Device identification: 0x00

This register contains version and revision identifiers and the mode-pins as sampled at boot-time.

Bits	Perm	Init	Description
31:24	RO	0x00	Chip identifier.
23:16	RO		Sampled values of pins MODE0, MODE1, ... on reset.
15:8	RO		SSwitch revision.
7:0	RO		SSwitch version.

0x00: Device identification

D.2 System switch description: 0x01

This register specifies the number of processors and links that are connected to this switch.

0x06: PLL settings

Bits	Perm	Init	Description
31:26	RO	-	Reserved
25:23	RW		OD: Output divider value The initial value depends on pins MODE0 and MODE1.
22:21	RO	-	Reserved
20:8	RW		F: Feedback multiplication ratio The initial value depends on pins MODE0 and MODE1.
7	RO	-	Reserved
6:0	RW		R: Oscilator input divider value The initial value depends on pins MODE0 and MODE1.

D.6 System switch clock divider: 0x07

Sets the ratio of the PLL clock and the switch clock.

0x07: System switch clock divider

Bits	Perm	Init	Description
31:16	RO	-	Reserved
15:0	RW	0	Switch clock divider. The PLL clock will be divided by this value plus one to derive the switch clock.

D.7 Reference clock: 0x08

Sets the ratio of the PLL clock and the reference clock used by the node.

0x08: Reference clock

Bits	Perm	Init	Description
31:16	RO	-	Reserved
15:0	RW	3	Architecture reference clock divider. The PLL clock will be divided by this value plus one to derive the 100 MHz reference clock.

D.8 Directions 0-7: 0x0C

This register contains eight directions, for packets with a mismatch in bits 7..0 of the node-identifier. The direction in which a packet will be routed is goverened by the most significant mismatching bit.

Bits	Perm	Init	Description
31	RW	0	Write '1' to this bit to enable the link, write '0' to disable it. This bit controls the muxing of ports with overlapping links.
30	RW	0	Set to 0 to operate in 2 wire mode or 1 to operate in 5 wire mode
29:28	RO	-	Reserved
27	RO	0	Set to 1 on error: an RX buffer overflow or illegal token encoding has been received. This bit clears on reading.
26	RO	0	1 if this end of the link has issued credit to allow the remote end to transmit.
25	RO	0	1 if this end of the link has credits to allow it to transmit.
24	WO	0	Set to 1 to initialize a half-duplex link. This clears this end of the link's credit and issues a HELLO token; the other side of the link will reply with credits. This bit is self-clearing.
23	WO	0	Set to 1 to reset the receiver. The next symbol that is detected will be assumed to be the first symbol in a token. This bit is self-clearing.
22	RO	-	Reserved
21:11	RW	0	The number of system clocks between two subsequent transitions within a token
10:0	RW	0	The number of system clocks between two subsequent transmit tokens.

0x80 .. 0x87: Link configuration and initialization

D.15 Static link configuration: 0xA0 .. 0xA7

These registers are used for static (ie, non-routed) links. When a link is made static, all traffic is forwarded to the designated channel end and no routing is attempted. The registers control links C, D, A, B, G, H, E, and F in that order.

Bits	Perm	Init	Description
31	RW	0	Enable static forwarding.
30:5	RO	-	Reserved
4:0	RW	0	The destination channel end on this node that packets received in static mode are forwarded to.

0xA0 .. 0xA7: Static link configuration

☐ Pins MODE0 and MODE1 are set to the correct value for the chosen oscillator frequency. The MODE settings are shown in the Oscillator section, Section 6. If you have a choice between two values, choose the value with the highest multiplier ratio since that will boot faster.

H.5 USB ULPI Mode

This section can be skipped if you do not have an external USB PHY.

☐ If using ULPI, the ULPI signals are connected to specific ports as shown in Section E.

☐ If using ULPI, the ports that are used internally are not connected, see Section E. (Note that this limitation only applies when the ULPI is enabled, they can still be used before or after the ULPI is being used.)

H.6 Boot

☐ The device is connected to a SPI flash for booting, connected to X0D0, X0D01, X0D10, and X0D11 (Section 7). If not, you must boot the device through OTP or JTAG.

☐ The device that is connected to flash has both MODE2 and MODE3 connected to pin 3 on the xSYS Header (MSEL). If no debug adapter connection is supported (not recommended) MODE2 and MODE3 are to be left NC (Section 7).

☐ The SPI flash that you have chosen is supported by **xflash**, or you have created a specification file for it.

H.7 JTAG, XScope, and debugging

☐ You have decided as to whether you need an XSYS header or not (Section G)

☐ If you included an XSYS header, you connected pin 3 to any MODE2/MODE3 pin that would otherwise be NC (Section G).

☐ If you have not included an XSYS header, you have devised a method to program the SPI-flash or OTP (Section G).

H.8 GPIO

☐ You have not mapped both inputs and outputs to the same multi-bit port.

H.9 Multi device designs

Skip this section if your design only includes a single XMOS device.

- ☐ One device is connected to a SPI flash for booting.
- ☐ Devices that boot from link have MODE2 grounded and MODE3 NC. These device must have link XLB connected to a device to boot from (see 7).
- ☐ If you included an XSYS header, you have included buffers for RST_N, TRST_N, TMS, TCK, MODE2, and MODE3 (Section F).
