

Welcome to [E-XFL.COM](https://www.e-xfl.com)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

Product Status	Active
Core Processor	MIPS32® M4K™
Core Size	32-Bit Single-Core
Speed	40MHz
Connectivity	I ² C, IrDA, LINbus, PMP, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, I ² S, POR, PWM, WDT
Number of I/O	21
Program Memory Size	16KB (16K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	4K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 3.6V
Data Converters	A/D 10x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	28-VQFN Exposed Pad
Supplier Device Package	28-QFN (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mx110f016bt-v-ml

PIC32MX1XX/2XX 28/36/44-PIN FAMILY

NOTES:

PIC32MX1XX/2XX 28/36/44-PIN FAMILY

3.2 Architecture Overview

The MIPS32 M4K processor core contains several logic blocks working together in parallel, providing an efficient high-performance computing engine. The following blocks are included with the core:

- Execution Unit
- Multiply/Divide Unit (MDU)
- System Control Coprocessor (CP0)
- Fixed Mapping Translation (FMT)
- Dual Internal Bus interfaces
- Power Management
- MIPS16e® Support
- Enhanced JTAG (EJTAG) Controller

3.2.1 EXECUTION UNIT

The MIPS32 M4K processor core execution unit implements a load/store architecture with single-cycle ALU operations (logical, shift, add, subtract) and an autonomous multiply/divide unit. The core contains thirty-two 32-bit General Purpose Registers (GPRs) used for integer operations and address calculation. The register file consists of two read ports and one write port and is fully bypassed to minimize operation latency in the pipeline.

The execution unit includes:

- 32-bit adder used for calculating the data address
- Address unit for calculating the next instruction address
- Logic for branch determination and branch target address calculation
- Load aligner
- Bypass multiplexers used to avoid stalls when executing instruction streams where data producing instructions are followed closely by consumers of their results
- Leading Zero/One detect unit for implementing the CLZ and CLO instructions
- Arithmetic Logic Unit (ALU) for performing bitwise logical operations
- Shifter and store aligner

3.2.2 MULTIPLY/DIVIDE UNIT (MDU)

The MIPS32 M4K processor core includes a Multiply/Divide Unit (MDU) that contains a separate pipeline for multiply and divide operations. This pipeline operates in parallel with the Integer Unit (IU) pipeline and does not stall when the IU pipeline stalls. This allows MDU operations to be partially masked by system stalls and/or other integer unit instructions.

The high-performance MDU consists of a 32x16 booth recoded multiplier, result/accumulation registers (HI and LO), a divide state machine, and the necessary multiplexers and control logic. The first number shown ('32' of 32x16) represents the *rs* operand. The second number ('16' of 32x16) represents the *rt* operand. The PIC32 core only checks the value of the latter (*rt*) operand to determine how many times the operation must pass through the multiplier. The 16x16 and 32x16 operations pass through the multiplier once. A 32x32 operation passes through the multiplier twice.

The MDU supports execution of one 16x16 or 32x16 multiply operation every clock cycle; 32x32 multiply operations can be issued every other clock cycle. Appropriate interlocks are implemented to stall the issuance of back-to-back 32x32 multiply operations. The multiply operand size is automatically determined by logic built into the MDU.

Divide operations are implemented with a simple 1 bit per clock iterative algorithm. An early-in detection checks the sign extension of the dividend (*rs*) operand. If *rs* is 8 bits wide, 23 iterations are skipped. For a 16-bit wide *rs*, 15 iterations are skipped and for a 24-bit wide *rs*, 7 iterations are skipped. Any attempt to issue a subsequent MDU instruction while a divide is still active causes an IU pipeline stall until the divide operation is completed.

Table 3-1 lists the repeat rate (peak issue rate of cycles until the operation can be reissued) and latency (number of cycles until a result is available) for the PIC32 core multiply and divide instructions. The approximate latency and repeat rates are listed in terms of pipeline clocks.

TABLE 3-1: MIPS32® M4K® PROCESSOR CORE HIGH-PERFORMANCE INTEGER MULTIPLY/DIVIDE UNIT LATENCIES AND REPEAT RATES

Opcode	Operand Size (mul <i>rt</i>) (div <i>rs</i>)	Latency	Repeat Rate
MULT/MULTU, MADD/MADDU, MSUB/MSUBU	16 bits	1	1
	32 bits	2	2
MUL	16 bits	2	1
	32 bits	3	2
DIV/DIVU	8 bits	12	11
	16 bits	19	18
	24 bits	26	25
	32 bits	33	32

	CRCCEN	CRCCAPP ⁽¹⁾	CRCTYP	—	—	CRCCH<2:0>		

Legend:

R = Readable bit

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 31-30 **Unimplemented:** Read as '0'

bit 29-28 **BYTO<1:0>:** CRC Byte Order Selection bits

11 = Endian byte swap on half-word boundaries (i.e., source half-word order with reverse source byte order per half-word)

10 = Swap half-words on word boundaries (i.e., reverse source half-word order with source byte order per half-word)

01 = Endian byte swap on word boundaries (i.e., reverse source byte order)

00 = No swapping (i.e., source byte order)

bit 27 **WBO:** CRC Write Byte Order Selection bit⁽¹⁾

1 = Source data is written to the destination re-ordered as defined by BYTO<1:0>

0 = Source data is written to the destination unaltered

bit 26-25 **Unimplemented:** Read as '0'

bit 24 **BITO:** CRC Bit Order Selection bit

When CRCTYP (DCRCCON<15>) = 1 (CRC module is in IP Header mode):

1 = The IP header checksum is calculated Least Significant bit (LSb) first (i.e., reflected)

0 = The IP header checksum is calculated Most Significant bit (MSb) first (i.e., not reflected)

When CRCTYP (DCRCCON<15>) = 0 (CRC module is in LFSR mode):

1 = The LFSR CRC is calculated Least Significant bit first (i.e., reflected)

0 = The LFSR CRC is calculated Most Significant bit first (i.e., not reflected)

bit 23-13 **Unimplemented:** Read as '0'

bit 12-8 **PLEN<4:0>:** Polynomial Length bits

When CRCTYP (DCRCCON<15>) = 1 (CRC module is in IP Header mode):

These bits are unused.

When CRCTYP (DCRCCON<15>) = 0 (CRC module is in LFSR mode):

Denotes the length of the polynomial – 1.

bit 7 **CRCCEN:** CRC Enable bit

1 = CRC module is enabled and channel transfers are routed through the CRC module

0 = CRC module is disabled and channel transfers proceed normally

Note 1: When WBO = 1, unaligned transfers are not supported and the CRCCAPP bit cannot be set.

11.3 Peripheral Pin Select

A major challenge in general purpose devices is providing the largest possible set of peripheral features while minimizing the conflict of features on I/O pins. The challenge is even greater on low pin-count devices. In an application where more than one peripheral needs to be assigned to a single pin, inconvenient workarounds in application code or a complete redesign may be the only option.

The Peripheral Pin Select (PPS) configuration provides an alternative to these choices by enabling peripheral set selection and their placement on a wide range of I/O pins. By increasing the pinout options available on a particular device, users can better tailor the device to their entire application, rather than trimming the application to fit the device.

The PPS configuration feature operates over a fixed subset of digital I/O pins. Users may independently map the input and/or output of most digital peripherals to these I/O pins. PPS is performed in software and generally does not require the device to be reprogrammed. Hardware safeguards are included that prevent accidental or spurious changes to the peripheral mapping once it has been established.

11.3.1 AVAILABLE PINS

The number of available pins is dependent on the particular device and its pin count. Pins that support the PPS feature include the designation “RPn” in their full pin designation, where “RP” designates a remappable peripheral and “n” is the remappable port number.

11.3.2 AVAILABLE PERIPHERALS

The peripherals managed by the PPS are all digital-only peripherals. These include general serial communications (UART and SPI), general purpose timer clock inputs, timer-related peripherals (input capture and output compare) and interrupt-on-change inputs.

In comparison, some digital-only peripheral modules are never included in the PPS feature. This is because the peripheral's function requires special I/O circuitry on a specific port and cannot be easily connected to multiple pins. These modules include I²C among others. A similar requirement excludes all modules with analog inputs, such as the Analog-to-Digital Converter (ADC).

A key difference between remappable and non-remappable peripherals is that remappable peripherals are not associated with a default I/O pin. The peripheral must always be assigned to a specific I/O pin before it can be used. In contrast, non-remappable peripherals are always available on a default pin, assuming that the peripheral is active and not conflicting with another peripheral.

When a remappable peripheral is active on a given I/O pin, it takes priority over all other digital I/O and digital communication peripherals associated with the pin.

Priority is given regardless of the type of peripheral that is mapped. Remappable peripherals never take priority over any analog functions associated with the pin.

11.3.3 CONTROLLING PERIPHERAL PIN SELECT

PPS features are controlled through two sets of SFRs: one to map peripheral inputs, and one to map outputs. Because they are separately controlled, a particular peripheral's input and output (if the peripheral has both) can be placed on any selectable function pin without constraint.

The association of a peripheral to a peripheral-selectable pin is handled in two different ways, depending on whether an input or output is being mapped.

11.3.4 INPUT MAPPING

The inputs of the PPS options are mapped on the basis of the peripheral. That is, a control register associated with a peripheral dictates the pin it will be mapped to. The [pin name]R registers, where [pin name] refers to the peripheral pins listed in Table 11-1, are used to configure peripheral input mapping (see Register 11-1). Each register contains sets of 4 bit fields. Programming these bit fields with an appropriate value maps the RPn pin with the corresponding value to that peripheral. For any given device, the valid range of values for any bit field is shown in Table 11-1.

For example, Figure 11-2 illustrates the remappable pin selection for the U1RX input.

Revision E (October 2012)

All singular pin diagram occurrences of CVREF were changed to: CVREFOUT. In addition, minor text and formatting changes were incorporated throughout the document.

All major changes are referenced by their respective section in Table A-4.

TABLE A-4: MAJOR SECTION UPDATES

Section	Update Description
“32-bit Microcontrollers (up to 128 KB Flash and 32 KB SRAM) with Audio and Graphics Interfaces, USB, and Advanced Analog”	Updated the following feature sections: <ul style="list-style-type: none">• “Operating Conditions”• “Communication Interfaces”
2.0 “Guidelines for Getting Started with 32-bit MCUs”	Removed Section 2.8 “Configuration of Analog and Digital Pins During ICSP Operations”.
3.0 “CPU”	Removed references to GPR shadow registers in 3.1 “Features” and 3.2.1 “Execution Unit” .
4.0 “Memory Organization”	Updated the BRG bit range in the SPI1 and SPI2 Register Map (see Table 4-8). Added the PWP<6> bit to the Device Configuration Word Summary (see Table 4-17).
5.0 “Flash Program Memory”	Added a note with Flash page size and row size information.
7.0 “Interrupt Controller”	Updated the TPC<2:0> bit definitions (see Register 7-1). Updated the IPTMR<31:0> bit definition (see Register 7-3).
8.0 “Oscillator Configuration”	Updated the PIC32MX1XX/2XX Family Clock Diagram (see Figure 8-1). Updated the RODIV<14:0> bit definitions (see Register 8-3).
10.0 “USB On-The-Go (OTG)”	Updated the Notes in the USB Interface Diagram (see Figure 10-1).
18.0 “Universal Asynchronous Receiver Transmitter (UART)”	Updated the baud rate range in the list of primary features.
26.0 “Special Features”	Added the PWP<6> bit to the Device Configuration Word 0 (see Register 26-1).
29.0 “Electrical Characteristics”	Added Note 1 to Operating MIPS vs. Voltage (see Table 29-1). Added Note 2 to DC Temperature and Voltage Specifications (see Table 29-4). Updated the Conditions for parameter DC25 in DC Characteristics: Operating Current (IDD) (see Table 29-5). Added Note 2 to Electrical Characteristics: BOR (see Table 29-10). Added Note 4 to Comparator Specifications (see Table 29-12). Added Note 5 to ADC Module Specifications (see Table 29-32). Updated the 10-bit Conversion Rate Parameters and added Note 3 (see Table 29-33). Added Note 4 to the Analog-to-Digital Conversion Timing Requirements (see Table 29-34). Added Note 3 to CTMU Current Source Specifications (see Table 29-39).
30.0 “50 MHz Electrical Characteristics”	New chapter with electrical characteristics for 50 MHz devices.
31.0 “Packaging Information”	The 36-pin and 44-pin VTLA packages have been updated.

PIC32MX1XX/2XX 28/36/44-PIN FAMILY

Revision F (February 2014)

This revision includes the addition of the following devices:

- PIC32MX170F256B
- PIC32MX270F256B
- PIC32MX170F256D
- PIC32MX270F256D

In addition, this revision includes the following major changes as described in Table A-5, as well as minor updates to text and formatting, which were incorporated throughout the document.

TABLE A-5: MAJOR SECTION UPDATES

Section	Update Description
32-bit Microcontrollers (up to 256 KB Flash and 64 KB SRAM) with Audio and Graphics Interfaces, USB, and Advanced Analog	Added new devices to the family features (see Table 1 and Table 2). Updated pin diagrams to include new devices (see “Pin Diagrams”).
1.0 “Device Overview”	Added Note 3 reference to the following pin names: VBUS, VUSB3V3, VBUSON, D+, D-, and USBID.
2.0 “Guidelines for Getting Started with 32-bit MCUs”	Replaced Figure 2-1: Recommended Minimum Connection. Updated Figure 2-2: MCLR Pin Connections. Added 2.9 “Sosc Design Recommendation” .
4.0 “Memory Organization”	Added memory tables for devices with 64 KB RAM (see Table 4-4 through Table 4-5). Changed the Virtual Addresses for all registers and updated the PWP bits in the DEVCFG: Device Configuration Word Summary (see Table 4-17). Updated the ODCA, ODCB, and ODCC port registers (see Table 4-19, Table 4-20, and Table 4-21). The RTCTIME, RTCDATE, ALRMTIME, and ALRMDATE registers were updated (see Table 4-25). Added Data Ram Size value for 64 KB RAM devices (see Register 4-5). Added Program Flash Size value for 256 KB Flash devices (see Register 4-5).
12.0 “Timer1”	The Timer1 block diagram was updated to include the 16-bit data bus (see Figure 12-1).
13.0 “Timer2/3, Timer4/5”	The Timer2-Timer5 block diagram (16-bit) was updated to include the 16-bit data bus (see Figure 13-1). The Timer2/3, Timer4/5 block diagram (32-bit) was updated to include the 32-bit data bus (see Figure 13-1).
19.0 “Parallel Master Port (PMP)”	The CSF<1:0> bit value definitions for ‘00’ and ‘01’ were updated (see Register 19-1). Bit 14 in the Parallel Port Address register (PMADDR) was updated (see Register 19-3).
20.0 “Real-Time Clock and Calendar (RTCC)”	The following registers were updated: RTCTIME (see Register 20-3) RTCDATE (see Register 20-4) ALRMTIME (see Register 20-5) ALRMDATE (see Register 20-6)
26.0 “Special Features”	Updated the PWP bits (see Register 26-1).
29.0 “Electrical Characteristics”	Added parameters DO50 and DO50a to the Capacitive Loading Requirements on Output Pins (see Table 29-14). Added Note 5 to the IDD DC Characteristics (see Table 29-5). Added Note 4 to the IDLE DC Characteristics (see Table 29-6). Added Note 5 to the IPD DC Characteristics (see Table 29-7). Updated the conditions for parameters USB321 (VOL) and USB322 (VOH) in the OTG Electrical Specifications (see Table 29-38).
Product Identification System	Added 40 MHz speed information.
