

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

Details

E·XFI

Product Status	Active
Core Processor	MIPS32® M4K™
Core Size	32-Bit Single-Core
Speed	40MHz
Connectivity	I ² C, IrDA, LINbus, PMP, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, I ² S, POR, PWM, WDT
Number of I/O	21
Program Memory Size	64KB (64K x 8)
Program Memory Type	FLASH
EEPROM Size	- ·
RAM Size	16K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 3.6V
Data Converters	A/D 10x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mx130f064b-v-so

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

Note 1: The RPn pins can be used by remappable peripherals. See Table 1 for the available peripherals and Section 11.3 "Peripheral Pin Select" for restrictions.

2: Every I/O port pin (RAx-RCx) can be used as a change notification pin (CNAx-CNCx). See Section 11.0 "I/O Ports" for more information.

3: Shaded pins are 5V tolerant.

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

TTL = TTL input buffer PPS = Peripheral Pin Select

Note 1: Pin numbers are provided for reference only. See the "Pin Diagrams" section for device pin availability.

2: Pin number for PIC32MX1XX devices only.

3: Pin number for PIC32MX2XX devices only.

— = N/A

PIC32MX1XX/2XX 28/36/44-PIN FAMILY

Pull-up resistors, series diodes and capacitors on the PGECx and PGEDx pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (VIH) and input low (VIL) requirements.

Ensure that the "Communication Channel Select" (i.e., PGECx/PGEDx pins) programmed into the device matches the physical connections for the ICSP to MPLAB[®] ICD 3 or MPLAB REAL ICETM.

For more information on ICD 3 and REAL ICE connection requirements, refer to the following documents that are available on the Microchip web site:

- "Using MPLAB[®] ICD 3" (poster) (DS50001765)
- *"MPLAB[®] ICD 3 Design Advisory"* (DS50001764)
- "MPLAB[®] REAL ICE™ In-Circuit Debugger User's Guide" (DS50001616)
- "Using MPLAB[®] REAL ICE™ Emulator" (poster) (DS50001749)

2.6 JTAG

The TMS, TDO, TDI and TCK pins are used for testing and debugging according to the Joint Test Action Group (JTAG) standard. It is recommended to keep the trace length between the JTAG connector and the JTAG pins on the device as short as possible. If the JTAG connector is expected to experience an ESD event, a series resistor is recommended with the value in the range of a few tens of Ohms, not to exceed 100 Ohms.

Pull-up resistors, series diodes and capacitors on the TMS, TDO, TDI and TCK pins are not recommended as they will interfere with the programmer/debugger communications to the device. If such discrete components are an application requirement, they should be removed from the circuit during programming and debugging. Alternatively, refer to the AC/DC characteristics and timing requirements information in the respective device Flash programming specification for information on capacitive loading limits and pin input voltage high (VIH) and input low (VIL) requirements.

2.7 External Oscillator Pins

Many MCUs have options for at least two oscillators: a high-frequency primary oscillator and a low-frequency secondary oscillator (refer to **Section 8.0 "Oscillator Configuration"** for details).

The oscillator circuit should be placed on the same side of the board as the device. Also, place the oscillator circuit close to the respective oscillator pins, not exceeding one-half inch (12 mm) distance between them. The load capacitors should be placed next to the oscillator itself, on the same side of the board. Use a grounded copper pour around the oscillator circuit to isolate them from surrounding circuits. The grounded copper pour should be routed directly to the MCU ground. Do not run any signal traces or power traces inside the ground pour. Also, if using a two-sided board, avoid any traces on the other side of the board where the crystal is placed. A suggested layout is illustrated in Figure 2-3.

FIGURE 2-3: SUGGESTED OSCILLATOR CIRCUIT PLACEMENT

2.8 Unused I/Os

Unused I/O pins should not be allowed to float as inputs. They can be configured as outputs and driven to a logic-low state.

Alternatively, inputs can be reserved by connecting the pin to Vss through a 1k to 10k resistor and configuring the pin as an input.

2.9 Typical Application Connection Examples

Examples of typical application connections are shown in Figure 2-5 and Figure 2-6.

bit 31-16 Unimplemented: Read as '0'

- bit 15 SPISGNEXT: Sign Extend Read Data from the RX FIFO bit
 - 1 = Data from RX FIFO is sign extended
 - 0 = Data from RX FIFO is not sign extended
- bit 14-13 Unimplemented: Read as '0'
- bit 12 **FRMERREN:** Enable Interrupt Events via FRMERR bit
 - 1 = Frame Error overflow generates error events
 - 0 = Frame Error does not generate error events
- bit 11 SPIROVEN: Enable Interrupt Events via SPIROV bit
 - 1 = Receive overflow generates error events
 - 0 = Receive overflow does not generate error events
- bit 10 SPITUREN: Enable Interrupt Events via SPITUR bit
 - 1 = Transmit underrun generates error events
 - 0 = Transmit underrun does not generate error events
- bit 9 IGNROV: Ignore Receive Overflow bit (for Audio Data Transmissions)
 - 1 = A ROV is not a critical error; during ROV data in the FIFO is not overwritten by receive data
 0 = A ROV is a critical error that stops SPI operation
- bit 8 **IGNTUR:** Ignore Transmit Underrun bit (for Audio Data Transmissions)
 - 1 = A TUR is not a critical error and zeros are transmitted until the SPIxTXB is not empty
 - 0 = A TUR is a critical error that stops SPI operation
- bit 7 AUDEN: Enable Audio CODEC Support bit⁽¹⁾
- 1 = Audio protocol enabled
 - 0 = Audio protocol disabled
- bit 6-5 Unimplemented: Read as '0'
- bit 3 AUDMONO: Transmit Audio Data Format bit^(1,2)
 - 1 = Audio data is mono (Each data word is transmitted on both left and right channels)
 - 0 = Audio data is stereo
- bit 2 Unimplemented: Read as '0'
- bit 1-0 AUDMOD<1:0>: Audio Protocol Mode bit^(1,2)
 - 11 = PCM/DSP mode
 - 10 = Right-Justified mode
 - 01 = Left-Justified mode
 - $00 = I^2S \mod$
- **Note 1:** This bit can only be written when the ON bit = 0.
 - 2: This bit is only valid for AUDEN = 1.

REGISTER 20-2: PMMODE: PARALLEL PORT MODE REGISTER (CONTINUED)

- bit 1-0 WAITE<1:0>: Data Hold After Read/Write Strobe Wait States bits⁽¹⁾
 - 11 = Wait of 4 Трв
 - 10 = Wait of 3 Трв
 - 01 = Wait of 2 TPB
 - 00 = Wait of 1 TPB (default)

For Read operations:

- 11 = Wait of 3 Трв
- 10 = Wait of 2 TPB
- 01 = Wait of 1 Трв
- 00 = Wait of 0 TPB (default)
- **Note 1:** Whenever WAITM<3:0> = 0000, WAITB and WAITE bits are ignored and forced to 1 TPBCLK cycle for a write operation; WAITB = 1 TPBCLK cycle, WAITE = 0 TPBCLK cycles for a read operation.
 - 2: Address bit A14 is not subject to auto-increment/decrement if configured as Chip Select CS1.

 - 0010 = CTED2 pin is selected
 - 0001 = OC1 Compare Event is selected 0000 = Timer1 Event is selected

bit 25 EDG2STAT: Edge2 Status bit

Indicates the status of Edge2 and can be written to control edge source

- 1 = Edge2 has occurred
- 0 = Edge2 has not occurred
- Note 1: When this bit is set for Pulse Delay Generation, the EDG2SEL<3:0> bits must be set to '1110' to select C2OUT.
 - 2: The ADC module Sample and Hold capacitor is not automatically discharged between sample/conversion cycles. Software using the ADC as part of a capacitive measurement, must discharge the ADC capacitor before conducting the measurement. The IDISSEN bit, when set to '1', performs this function. The ADC module must be sampling while the IDISSEN bit is active to connect the discharge sink to the capacitor array.
 - 3: Refer to the CTMU Current Source Specifications (Table 30-41) in Section 30.0 "Electrical Characteristics" for current values.
 - 4: This bit setting is not available for the CTMU temperature diode.

29.6 MPLAB X SIM Software Simulator

The MPLAB X SIM Software Simulator allows code development in a PC-hosted environment by simulating the PIC MCUs and dsPIC DSCs on an instruction level. On any given instruction, the data areas can be examined or modified and stimuli can be applied from a comprehensive stimulus controller. Registers can be logged to files for further run-time analysis. The trace buffer and logic analyzer display extend the power of the simulator to record and track program execution, actions on I/O, most peripherals and internal registers.

The MPLAB X SIM Software Simulator fully supports symbolic debugging using the MPLAB XC Compilers, and the MPASM and MPLAB Assemblers. The software simulator offers the flexibility to develop and debug code outside of the hardware laboratory environment, making it an excellent, economical software development tool.

29.7 MPLAB REAL ICE In-Circuit Emulator System

The MPLAB REAL ICE In-Circuit Emulator System is Microchip's next generation high-speed emulator for Microchip Flash DSC and MCU devices. It debugs and programs all 8, 16 and 32-bit MCU, and DSC devices with the easy-to-use, powerful graphical user interface of the MPLAB X IDE.

The emulator is connected to the design engineer's PC using a high-speed USB 2.0 interface and is connected to the target with either a connector compatible with in-circuit debugger systems (RJ-11) or with the new high-speed, noise tolerant, Low-Voltage Differential Signal (LVDS) interconnection (CAT5).

The emulator is field upgradable through future firmware downloads in MPLAB X IDE. MPLAB REAL ICE offers significant advantages over competitive emulators including full-speed emulation, run-time variable watches, trace analysis, complex breakpoints, logic probes, a ruggedized probe interface and long (up to three meters) interconnection cables.

29.8 MPLAB ICD 3 In-Circuit Debugger System

The MPLAB ICD 3 In-Circuit Debugger System is Microchip's most cost-effective, high-speed hardware debugger/programmer for Microchip Flash DSC and MCU devices. It debugs and programs PIC Flash microcontrollers and dsPIC DSCs with the powerful, yet easy-to-use graphical user interface of the MPLAB IDE.

The MPLAB ICD 3 In-Circuit Debugger probe is connected to the design engineer's PC using a highspeed USB 2.0 interface and is connected to the target with a connector compatible with the MPLAB ICD 2 or MPLAB REAL ICE systems (RJ-11). MPLAB ICD 3 supports all MPLAB ICD 2 headers.

29.9 PICkit 3 In-Circuit Debugger/ Programmer

The MPLAB PICkit 3 allows debugging and programming of PIC and dsPIC Flash microcontrollers at a most affordable price point using the powerful graphical user interface of the MPLAB IDE. The MPLAB PICkit 3 is connected to the design engineer's PC using a fullspeed USB interface and can be connected to the target via a Microchip debug (RJ-11) connector (compatible with MPLAB ICD 3 and MPLAB REAL ICE). The connector uses two device I/O pins and the Reset line to implement in-circuit debugging and In-Circuit Serial Programming[™] (ICSP[™]).

29.10 MPLAB PM3 Device Programmer

The MPLAB PM3 Device Programmer is a universal, CE compliant device programmer with programmable voltage verification at VDDMIN and VDDMAX for maximum reliability. It features a large LCD display (128 x 64) for menus and error messages, and a modular, detachable socket assembly to support various package types. The ICSP cable assembly is included as a standard item. In Stand-Alone mode, the MPLAB PM3 Device Programmer can read, verify and program PIC devices without a PC connection. It can also set code protection in this mode. The MPLAB PM3 connects to the host PC via an RS-232 or USB cable. The MPLAB PM3 has high-speed communications and optimized algorithms for quick programming of large memory devices, and incorporates an MMC card for file storage and data applications.
