**Welcome to **

What is "**Embedded - Microcontrollers**"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "**Embedded - Microcontrollers**"

Details	
Product Status	Obsolete
Core Processor	MIPS32® M4K™
Core Size	32-Bit Single-Core
Speed	40MHz
Connectivity	I²C, IrDA, LINbus, PMP, SPI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	33
Program Memory Size	128KB (128K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	32K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 3.6V
Data Converters	A/D 13x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	44-VFTLA Exposed Pad
Supplier Device Package	44-VTLA (6x6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mx250f128d-v-tl

Note 1: The RPn pins can be used by remappable peripherals. See Table 1 for the available peripherals and **Section 11.3 "Peripheral Pin Select"** for restrictions.

2: Every I/O port pin (RAx-RCx) can be used as a change notification pin (CNAx-CNCx). See **Section 11.0 "I/O Ports"** for more information.

3: The metal plane at the bottom of the device is not connected to any pins and is recommended to be connected to V_{SS} externally.

4: This pin function is not available on PIC32MX110F016D and PIC32MX120F032D devices.

5: Shaded pins are 5V tolerant.

The MIPS architecture defines that the result of a multiply or divide operation be placed in the HI and LO registers. Using the Move-From-HI (MFHI) and Move-From-LO (MFLO) instructions, these values can be transferred to the General Purpose Register file.

In addition to the HI/LO targeted operations, the MIPS32® architecture also defines a multiply instruction, MUL, which places the least significant results in the primary register file instead of the HI/LO register pair. By avoiding the explicit MFLO instruction required when using the LO register, and by supporting multiple destination registers, the throughput of multiply-intensive operations is increased.

Two other instructions, Multiply-Add (MADD) and Multiply-Subtract (MSUB), are used to perform the multiply-accumulate and multiply-subtract operations. The MADD instruction multiplies two numbers and then adds the product to the current contents of the HI and LO registers. Similarly, the MSUB instruction multiplies two operands and then subtracts the product from the HI and LO registers. The MADD and MSUB operations are commonly used in DSP algorithms.

3.2.3 SYSTEM CONTROL COPROCESSOR (CP0)

In the MIPS architecture, CP0 is responsible for the virtual-to-physical address translation, the exception control system, the processor's diagnostics capability, the operating modes (Kernel, User and Debug) and whether interrupts are enabled or disabled. Configuration information, such as presence of options like MIPS16e, is also available by accessing the CP0 registers, listed in Table 3-2.

TABLE 3-2: COPROCESSOR 0 REGISTERS

Register Number	Register Name	Function
0-6	Reserved	Reserved in the PIC32MX1XX/2XX family core.
7	HWREna	Enables access via the RDHWR instruction to selected hardware registers.
8	BadVAddr[1]	Reports the address for the most recent address-related exception.
9	Count[1]	Processor cycle count.
10	Reserved	Reserved in the PIC32MX1XX/2XX family core.
11	Compare[1]	Timer interrupt control.
12	Status[1]	Processor status and control.
12	IntCtl[1]	Interrupt system status and control.
12	SRSCtl[1]	Shadow register set status and control.
12	SRSMap[1]	Provides mapping from vectored interrupt to a shadow set.
13	Cause[1]	Cause of last general exception.
14	EPC[1]	Program counter at last exception.
15	PRId	Processor identification and revision.
15	EBASE	Exception vector base register.
16	Config	Configuration register.
16	Config1	Configuration Register 1.
16	Config2	Configuration Register 2.
16	Config3	Configuration Register 3.
17-22	Reserved	Reserved in the PIC32MX1XX/2XX family core.
23	Debug[2]	Debug control and exception status.
24	DEPC[2]	Program counter at last debug exception.
25-29	Reserved	Reserved in the PIC32MX1XX/2XX family core.
30	ErrorEPC[1]	Program counter at last error.
31	DESAVE[2]	Debug handler scratchpad register.

Note 1: Registers used in exception processing.

2: Registers used during debug.

This value is always '0', which forces 2 KB increments

Note 1: At Reset, the value in this register is forced to zero, which causes all of the RAM to be allocated to Kernal mode data usage.

**2:** The value in this register must be less than or equal to BMXPFMSZ.

6.0 RESETS

Note:	This data sheet summarizes the features of the PIC32MX1XX/2XX 28/36/44-pin Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 7. "Resets"** (DS60001118), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The Reset module combines all Reset sources and controls the device Master Reset signal, SYSRST. The following is a list of device Reset sources:

- Power-on Reset (POR)
- Master Clear Reset pin (MCLR)
- Software Reset (SWR)
- Watchdog Timer Reset (WDTR)
- Brown-out Reset (BOR)
- Configuration Mismatch Reset (CMR)

A simplified block diagram of the Reset module is illustrated in Figure 6-1.

> Writing to this register will seed the CRC generator. Reading from this register will return the current value of the CRC. Bits greater than PLEN will return '0' on any read.

> When CRCTYP (DCRCCON<15>) = 1 (CRC module is in IP Header mode):
> Only the lower 16 bits contain IP header checksum information. The upper 16 bits are always '0'. Data written to this register is converted and read back in 1's complement form (i.e., current IP header checksum value).

> When CRCTYP (DCRCCON<15>) = 0 (CRC module is in LFSR mode):
> Bits greater than PLEN will return '0' on any read.

NOTES:

26.4.1 CONTROLLING CONFIGURATION CHANGES

Because peripherals can be disabled during run time, some restrictions on disabling peripherals are needed to prevent accidental configuration changes. PIC32 devices include two features to prevent alterations to enabled or disabled peripherals:

• Control register lock sequence
• Configuration bit select lock

26.4.1.1 Control Register Lock

Under normal operation, writes to the PMDx registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the Configuration bit, PMDLOCK (CFGCON<12>). Setting PMDLOCK prevents writes to the control registers; clearing PMDLOCK allows writes.

To set or clear PMDLOCK, an unlock sequence must be executed. Refer to **Section 6. "Oscillator"** (DS60001112) in the *"PIC32 Family Reference Manual"* for details.

26.4.1.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the PMDx registers. The Configuration bit, PMDL1WAY (DEVCFG3<28>), blocks the PMDLOCK bit from being cleared after it has been set once. If PMDLOCK remains set, the register unlock procedure does not execute, and the peripheral pin select control registers cannot be written to. The only way to clear the bit and re-enable PMD functionality is to perform a device Reset.

TABLE 30-6: DC CHARACTERISTICS: IDLE CURRENT (I$_{IDLE}$)

DC CHARACTERISTICS				Standard Operating Conditions: 2.3V to 3.6V (unless otherwise stated) Operating temperature -40°C ≤ T$_A$ ≤ +85°C for Industrial -40°C ≤ T$_A$ ≤ +105°C for V-temp		
Parameter No.	Typical[2]	Max.	Units	Conditions		
Idle Current (I$_{IDLE}$): Core Off, Clock on Base Current (Notes 1, 4)						
DC30a	1	1.5	mA	4 MHz **(Note 3)**		
DC31a	2	3	mA	10 MHz		
DC32a	4	6	mA	20 MHz **(Note 3)**

DC37b	250	—	µA	+25°C		
DC37c	380	—	µA	+85°C		

Note 1: The test conditions for I$_{IDLE}$ current measurements are as follows:

- Oscillator mode is EC (for 8 MHz and below) and EC+PLL (for above 8 MHz) with OSC1 driven by external square wave from rail-to-rail, (OSC1 input clock input over/undershoot < 100 mV required)
- OSC2/CLKO is configured as an I/O input pin
- USB PLL oscillator is disabled if the USB module is implemented, PBCLK divisor = 1:8
- CPU is in Idle mode (CPU core Halted), and SRAM data memory Wait states = 1
- No peripheral modules are operating, (ON bit = 0), but the associated PMD bit is cleared
- WDT, Clock Switching, Fail-Safe Clock Monitor, and Secondary Oscillator are disabled
- All I/O pins are configured as inputs and pulled to V$_{SS}$
- $\overline{MCLR}$ = V$_{DD}$
- RTCC and JTAG are disabled

2: Data in the "Typical" column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

3: This parameter is characterized, but not tested in manufacturing.

4: I$_{IDLE}$ electrical characteristics for devices with 256 KB Flash are only provided as Preliminary information.

DI56		OSC1	—	—	± 1	μA	$V_{SS} \leq V_{PIN} \leq V_{DD}$, XT and HS modes

Note 1: Data in "Typical" column is at 3.3V, 25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: The leakage current on the $\overline{MCLR}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

3: Negative current is defined as current sourced by the pin.

4: This parameter is characterized, but not tested in manufacturing.

5: See the **"Pin Diagrams"** section for the 5V-tolerant pins.

6: The V_{IH} specifications are only in relation to externally applied inputs, and not with respect to the user-selectable internal pull-ups. External open drain input signals utilizing the internal pull-ups of the PIC32 device are guaranteed to be recognized only as a logic "high" internally to the PIC32 device, provided that the external load does not exceed the minimum value of I_{CNPU}. For External "input" logic inputs that require a pull-up source, to guarantee the minimum V_{IH} of those components, it is recommended to use an external pull-up resistor rather than the internal pull-ups of the PIC32 device.
