

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	1920
Number of Logic Elements/Cells	-
Total RAM Bits	884736
Number of I/O	528
Number of Gates	1500000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	896-BBGA, FCBGA
Supplier Device Package	896-FCBGA (31x31)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xc2v1500-4ffg896i

Notes:

1. See details in [Table 2, "Maximum Number of User I/O Pads"](#).

General Description

The Virtex-II family is a platform FPGA developed for high performance from low-density to high-density designs that are based on IP cores and customized modules. The family delivers complete solutions for telecommunication, wireless, networking, video, and DSP applications, including PCI, LVDS, and DDR interfaces.

The leading-edge 0.15 μm / 0.12 μm CMOS 8-layer metal process and the Virtex-II architecture are optimized for high speed with low power consumption. Combining a wide variety of flexible features and a large range of densities up to 10 million system gates, the Virtex-II family enhances programmable logic design capabilities and is a powerful alternative to mask-programmed gates arrays. As shown in [Table 1](#), the Virtex-II family comprises 11 members, ranging from 40K to 8M system gates.

Packaging

Offerings include ball grid array (BGA) packages with 0.80 mm, 1.00 mm, and 1.27 mm pitches. In addition to traditional wire-bond interconnects, flip-chip interconnect is used in some of the BGA offerings. The use of flip-chip interconnect offers more I/Os than is possible in wire-bond versions of the similar packages. Flip-chip construction offers the combination of high pin count with high thermal capacity.

Wire-bond packages CS, FG, and BG are optionally available in Pb-free versions CSG, FGG, and BGG. See [Virtex-II Ordering Examples, page 6](#).

[Table 2](#) shows the maximum number of user I/Os available. The Virtex-II device/package combination table ([Table 6](#) at the end of this section) details the maximum number of I/Os for each device and package using wire-bond or flip-chip technology.

Table 2: Maximum Number of User I/O Pads

Device	Wire-Bond	Flip-Chip

Notes:

1. The carry-chains and SOP chains can be split or cascaded.

18 Kbit Block SelectRAM Resources

Introduction

Virtex-II devices incorporate large amounts of 18 Kbit block SelectRAM. These complement the distributed SelectRAM resources that provide shallow RAM structures implemented in CLBs. Each Virtex-II block SelectRAM is an 18 Kbit true dual-port RAM with two independently clocked and independently controlled synchronous ports that access a common storage area. Both ports are functionally identical. CLK, EN, WE, and SSR polarities are defined through configuration.

Each port has the following types of inputs: Clock and Clock Enable, Write Enable, Set/Reset, and Address, as well as separate Data/parity data inputs (for write) and Data/parity data outputs (for read).

Operation is synchronous; the block SelectRAM behaves like a register. Control, address and data inputs must (and need only) be valid during the set-up time window prior to a rising (or falling, a configuration option) clock edge. Data outputs change as a result of the same clock edge.

Configuration

The Virtex-II block SelectRAM supports various configurations, including single- and dual-port RAM and various

data/address aspect ratios. Supported memory configurations for single- and dual-port modes are shown in Table 14.

Table 14: Dual- and Single-Port Configurations

16K x 1 bit	2K x 9 bits
8K x 2 bits	1K x 18 bits
4K x 4 bits	512 x 36 bits

Single-Port Configuration

As a single-port RAM, the block SelectRAM has access to the 18 Kbit memory locations in any of the 2K x 9-bit, 1K x 18-bit, or 512 x 36-bit configurations and to 16 Kbit memory locations in any of the 16K x 1-bit, 8K x 2-bit, or 4K x 4-bit configurations. The advantage of the 9-bit, 18-bit and 36-bit widths is the ability to store a parity bit for each eight bits. Parity bits must be generated or checked externally in user logic. In such cases, the width is viewed as 8 + 1, 16 + 2, or 32 + 4. These extra parity bits are stored and behave exactly as the other bits, including the timing parameters. Video applications can use the 9-bit ratio of Virtex-II block SelectRAM memory to advantage.

Each block SelectRAM cell is a fully synchronous memory as illustrated in Figure 29. Input data bus and output data bus widths are identical.

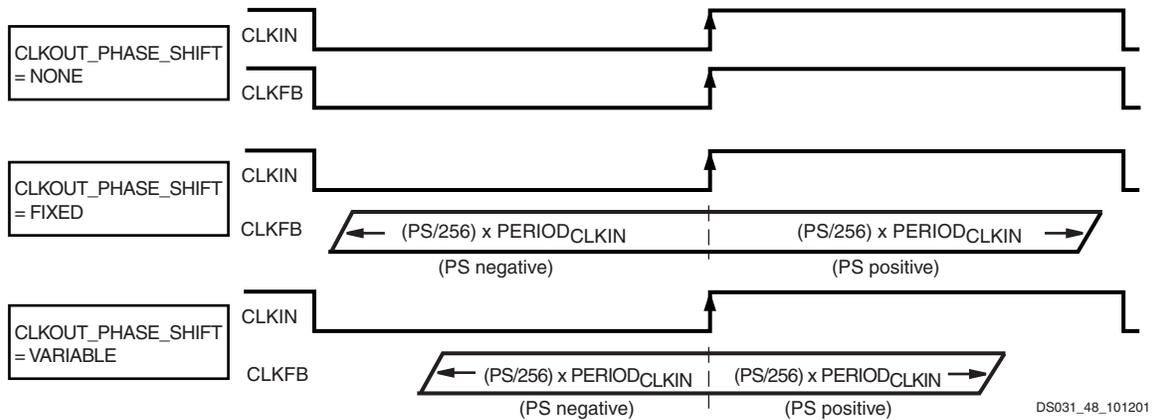

Figure 46: Fine-Phase Shifting Effects

Table 22 lists fine-phase shifting control pins, when used in variable mode.

Table 22: Fine-Phase Shifting Control Pins

Control Pin	Direction	Function
PSINCDEC	in	Increment or decrement
PSEN	in	Enable ± phase shift
PSCLK	in	Clock for phase shift
PSDONE	out	Active when completed

Two separate components of the phase shift range must be understood:

- PHASE_SHIFT attribute range
- FINE_SHIFT_RANGE DCM timing parameter range

The PHASE_SHIFT attribute is the numerator in the following equation:

$$\text{Phase Shift (ns)} = (\text{PHASE_SHIFT}/256) * \text{PERIOD}_{\text{CLKIN}}$$

The full range of this attribute is always -255 to +255, but its practical range varies with CLKIN frequency, as constrained by the FINE_SHIFT_RANGE component, which represents the total delay achievable by the phase shift delay line. Total delay is a function of the number of delay taps used in the circuit. Across process, voltage, and temperature, this absolute range is guaranteed to be as specified under **DCM Timing Parameters** in Module 3.

Absolute range (fixed mode) = ± FINE_SHIFT_RANGE

Absolute range (variable mode) = ± FINE_SHIFT_RANGE/2

Table 23: DCM Frequency Ranges

Output Clock	Low-Frequency Mode		High-Frequency Mode	
	CLKIN Input	CLK Output	CLKIN Input	CLK Output
CLK0, CLK180	CLKIN_FREQ_DLL_LF	CLKOUT_FREQ_1X_LF	CLKIN_FREQ_DLL_HF	CLKOUT_FREQ_1X_HF
CLK90, CLK270	CLKIN_FREQ_DLL_LF	CLKOUT_FREQ_1X_LF	NA	NA
CLK2X, CLK2X180	CLKIN_FREQ_DLL_LF	CLKOUT_FREQ_2X_LF	NA	NA
CLKDV	CLKIN_FREQ_DLL_LF	CLKOUT_FREQ_DV_LF	CLKIN_FREQ_DLL_HF	CLKOUT_FREQ_DV_HF
CLKFX, CLKFX180	CLKIN_FREQ_FX_LF	CLKOUT_FREQ_FX_LF	CLKIN_FREQ_FX_HF	CLKOUT_FREQ_FX_HF

The reason for the difference between fixed and variable modes is as follows. For variable mode to allow symmetric, dynamic sweeps from -255/256 to +255/256, the DCM sets the "zero phase skew" point as the middle of the delay line, thus dividing the total delay line range in half. In fixed mode, since the PHASE_SHIFT value never changes after configuration, the entire delay line is available for insertion into either the CLKIN or CLKFB path (to create either positive or negative skew).

Taking both of these components into consideration, the following are some usage examples:

- If $\text{PERIOD}_{\text{CLKIN}} = 2 * \text{FINE_SHIFT_RANGE}$, then PHASE_SHIFT in fixed mode is limited to ± 128, and in variable mode it is limited to ± 64.
- If $\text{PERIOD}_{\text{CLKIN}} = \text{FINE_SHIFT_RANGE}$, then PHASE_SHIFT in fixed mode is limited to ± 255, and in variable mode it is limited to ± 128.
- If $\text{PERIOD}_{\text{CLKIN}} \leq 0.5 * \text{FINE_SHIFT_RANGE}$, then PHASE_SHIFT is limited to ± 255 in either mode.

Operating Modes

The frequency ranges of DCM input and output clocks depend on the operating mode specified, either low-frequency mode or high-frequency mode, according to Table 23. (For actual values, see **Virtex-II Switching Characteristics** in Module 3). The CLK2X, CLK2X180, CLK90, and CLK270 outputs are not available in high-frequency mode.

High or low-frequency mode is selected by an attribute.

I/O Standard Adjustment Measurement Methodology

Input Delay Measurements

Table 18 shows the test setup parameters used for measuring Input standard adjustments (see Table 15, page 11).

Table 18: Input Delay Measurement Methodology

Description	IOSTANDARD Attribute	$V_L^{(1,2)}$	$V_H^{(1,2)}$	$V_{MEAS}^{(1,4,5)}$	$V_{REF}^{(1,3,5)}$
LVTTTL (Low-Voltage Transistor-Transistor Logic)	LVTTTL	0	3.0	1.4	–

HSTL, Class III & IV, 1.8V	HSTL_III_18, HSTL_IV_18	$V_{REF} - 0.5$	$V_{REF} + 0.5$	V_{REF}	1.08
SSTL (Stub Terminated Transceiver Logic), Class I & II, 3.3V	SSTL3_I, SSTL3_II	$V_{REF} - 1.00$	$V_{REF} + 1.00$	V_{REF}	1.5
SSTL, Class I & II, 2.5V	SSTL2_I, SSTL2_II	$V_{REF} - 0.75$	$V_{REF} + 0.75$	V_{REF}	1.25
SSTL, Class I & II, 1.8V	SSTL18_I, SSTL18_II	$V_{REF} - 0.5$	$V_{REF} + 0.5$	V_{REF}	0.90
AGP-2X/AGP (Accelerated Graphics Port)	AGP	$V_{REF} - (0.2 \times V_{CCO})$	$V_{REF} + (0.2 \times V_{CCO})$	V_{REF}	AGP Spec
LVDS (Low-Voltage Differential Signaling), 2.5V	LVDS_25	$1.2 - 0.125$	$1.2 + 0.125$	1.2	
LVDS, 3.3V	LVDS_33	$1.2 - 0.125$	$1.2 + 0.125$	1.2	
LVDS EXT (LVDS Extended Mode), 2.5V	LVDS EXT_25	$1.2 - 0.125$	$1.2 + 0.125$	1.2	
LVDS EXT, 3.3V	LVDS EXT_33	$1.2 - 0.125$	$1.2 + 0.125$	1.2	
ULVDS (Ultra LVDS), 2.5V	ULVDS_25	$0.6 - 0.125$	$0.6 + 0.125$	0.6	
LDT (HyperTransport), 2.5V	LDT_25	$0.6 - 0.125$	$0.6 + 0.125$	0.6	
LVPECL (Low-Voltage Positive Electron-Coupled Logic), 3.3V	LVPECL_33	$1.6 - 0.3$	$1.6 + 0.3$	1.6	

Notes:

1. Input delay measurement methodology parameters for LVDCI and HSLVDCI are the same as for LVC MOS standards of the same voltage. Parameters for all other DCI standards are the same as for the corresponding non-DCI standards.
2. Input waveform switches between V_L and V_H .
3. Measurements are made at typical, minimum, and maximum V_{REF} values. Reported delays reflect worst case of these measurements. V_{REF} values listed are typical. See [Virtex-II Platform FPGA User Guide](#) for min/max specifications.
4. Input voltage level from which measurement starts.
5. Note that this is an input voltage reference that bears no relation to the V_{REF} / V_{MEAS} parameters found in IBIS models and/or noted in Figure 1.

Table 19: Output Delay Measurement Methodology

Description	IOSTANDARD Attribute	R _{REF} (Ω)	C _{REF} ⁽¹⁾ (pF)	V _{MEAS} (V)	V _{REF} (V)

SSTL, Class I & II, 2.5V, with DCI	SSTL2_I_DCI, SSTL2_II_DCI	50	0	V _{REF}	1.25
SSTL, Class I & II, 3.3V, with DCI	SSTL3_I_DCI, SSTL3_II_DCI	50	0	V _{REF}	1.5
GTL (Gunning Transceiver Logic) with DCI	GTL_DCI	50	0	0.8	1.2
GTL Plus with DCI	GTL_P_DCI	50	0	1.0	1.5

Notes:

1. C_{REF} is the capacitance of the probe, nominally 0 pF.
2. Per PCI specifications.
3. Per PCI-X specifications.

Source Synchronous Timing Budgets

This section describes how to use the parameters provided in the [Source-Synchronous Switching Characteristics](#) section to develop system-specific timing budgets. The following analysis provides information necessary for determining Virtex-II contributions to an overall system timing analysis; no assumptions are made about the effects of Inter-Symbol Interference or PCB skew.

Virtex-II Transmitter Data-Valid Window (T_X)

T_X is the minimum aggregate valid data period for a source-synchronous data bus at the pins of the device and is calculated as follows:

$$T_X = \text{Data Period} - [\text{Jitter}^{(1)} + \text{Duty Cycle Distortion}^{(2)} + \text{TCKSKEW}^{(3)} + \text{TPKGSKEW}^{(4)}]$$

Notes:

1. Jitter values and accumulation methodology to be provided in a future release of this document. The absolute period jitter values found in the [DCM Timing Parameters](#) section of the particular DCM output clock used to clock the IOB FF can be used for a best case analysis.
2. This value depends on the clocking methodology used. See Note1 for [Table 45](#).
3. This value represents the worst-case clock-tree skew observable between sequential I/O elements. Significantly less clock-tree skew exists for I/O registers that are close to each other and fed by the same or adjacent clock-tree branches. Use the Xilinx FPGA_Editor and Timing Analyzer tools to evaluate clock skew specific to your application.
4. These values represent the worst-case skew between any two balls of the package: shortest flight time to longest flight time from Pad to Ball.

Virtex-II Receiver Data-Valid Window (R_X)

R_X is the required minimum aggregate valid data period for a source-synchronous data bus at the pins of the device and is calculated as follows:

$$R_X = [\text{TSAMP}^{(1)} + \text{TCKSKEW}^{(2)} + \text{TPKGSKEW}^{(3)}]$$

Notes:

1. This parameter indicates the total sampling error of Virtex-II DDR input registers across voltage, temperature, and process. The characterization methodology uses the DCM to capture the DDR input registers' edges of operation. These measurements include:
 - CLK0 and CLK180 DCM jitter in a quiet system
 - Worst-case duty-cycle distortion
 - DCM accuracy (phase offset)
 - DCM phase shift resolution.
 These measurements do not include package or clock tree skew.
2. This value represents the worst-case clock-tree skew observable between sequential I/O elements. Significantly less clock-tree skew exists for I/O registers that are close to each other and fed by the same or adjacent clock-tree branches. Use the Xilinx FPGA_Editor and Timing Analyzer tools to evaluate clock skew specific to your application.
3. These values represent the worst-case skew between any two balls of the package: shortest flight time to longest flight time from Pad to Ball.

Revision History

This section records the change history for this module of the data sheet.

Date	Version	Revision
11/07/00	1.0	Early access draft.
12/06/00	1.1	Initial release.
01/15/01	1.2	Added values to the tables in the Virtex-II Performance Characteristics and Virtex-II Switching Characteristics sections.
01/25/01	1.3	<ul style="list-style-type: none"> • The data sheet was divided into four modules (per the current style standard). • Updated values in the Virtex-II Performance Characteristics and Virtex-II Switching Characteristics tables. • Table 18, "Delay Measurement Methodology"
04/23/01	1.5	<ul style="list-style-type: none"> • Updated values in the Virtex-II Performance Characteristics and Virtex-II Switching Characteristics tables. • Added T_{REG32} symbol to Table 23. • Skipped v1.4 to sync with other modules. Reverted to traditional double-column format.

Pin Definitions

Table 4 provides a description of each pin type listed in Virtex-II pinout tables.

Table 4: Virtex-II Pin Definitions

Pin Name	Direction	Description
User I/O Pins		
IO_LXXY_#	Input/Output/ Bidirectional	All user I/O pins are capable of differential signalling and can implement LVDS, ULVDS, BLVDS, LVPECL, or LDT pairs. Each user I/O is labeled "IO_LXXY_#", where: IO indicates a user I/O pin. LXXY indicates a differential pair, with XX a unique pair in the bank and Y = P/N for the positive and negative sides of the differential pair. # indicates the bank number (0 through 7)
Dual-Function Pins		
IO_LXXY_#/ZZZ		The dual-function pins are labelled "IO_LXXY_#/ZZZ", where ZZZ can be one of the following pins: Per Bank - VRP , VRN , or VREF Globally - GCLKX(S/P) , BUSY/DOUT , INIT_B , D0/DIN – D7 , RDWR_B , or CS_B
With /ZZZ:		
D0/DIN, D1, D2, D3, D4, D5, D6, D7	Input/Output	<ul style="list-style-type: none"> In SelectMAP mode, D0 through D7 are configuration data pins. These pins become user I/Os after configuration, unless the SelectMAP port is retained. In bit-serial modes, DIN (D0) is the single-data input. This pin becomes a user I/O after configuration.
CS_B	Input	In SelectMAP mode, this is the active-low Chip Select signal. The pin becomes a user I/O after configuration, unless the SelectMAP port is retained.
RDWR_B	Input	In SelectMAP mode, this is the active-low Write Enable signal. The pin becomes a user I/O after configuration, unless the SelectMAP port is retained.
BUSY/DOUT	Output	<ul style="list-style-type: none"> In SelectMAP mode, BUSY controls the rate at which configuration data is loaded. The pin becomes a user I/O after configuration, unless the SelectMAP port is retained. In bit-serial modes, DOUT provides preamble and configuration data to downstream devices in a daisy-chain. The pin becomes a user I/O after configuration.
INIT_B	Bidirectional (open-drain)	When Low, this pin indicates that the configuration memory is being cleared. When held Low, the start of configuration is delayed. During configuration, a Low on this output indicates that a configuration data error has occurred. The pin becomes a user I/O after configuration.
GCLKx (S/P)	Input/Output	These are clock input pins that connect to Global Clock Buffers. These pins become regular user I/Os when not needed for clocks.
VRP	Input	This pin is for the DCI voltage reference resistor of P transistor (per bank).
VRN	Input	This pin is for the DCI voltage reference resistor of N transistor (per bank).
ALT_VRP	Input	This is the alternative pin for the DCI voltage reference resistor of P transistor.
ALT_VRN	Input	This is the alternative pin for the DCI voltage reference resistor of N transistor.
V _{REF}	Input	These are input threshold voltage pins. They become user I/Os when an external threshold voltage is not needed (per bank).
Dedicated Pins⁽¹⁾		
CCLK	Input/Output	Configuration clock. Output in Master mode or Input in Slave mode.
