Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Detailed Description

Input/Output Blocks (IOBs)

Virtex-II™ I/O blocks (IOBs) are provided in groups of two or four on the perimeter of each device. Each IOB can be used as input and/or output for single-ended I/Os. Two IOBs can be used as a differential pair. A differential pair is always connected to the same switch matrix, as shown in Figure 1.

IOB blocks are designed for high performances I/Os, supporting 19 single-ended standards, as well as differential signaling with LVDS, LDT, Bus LVDS, and LVPECL.

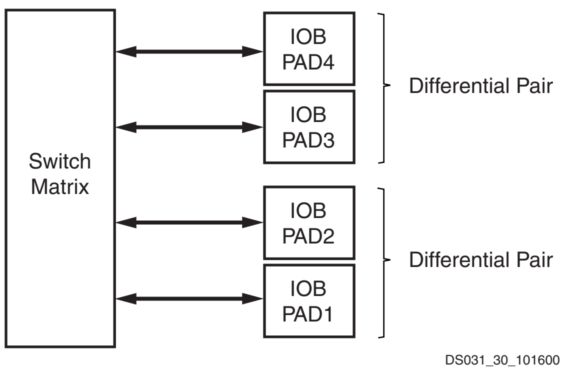

Figure 1: **Virtex-II Input/Output Tile**

Note: Differential I/Os must use the same clock.

Supported I/O Standards

Virtex-II IOB blocks feature SelectI/O-Ultra inputs and outputs that support a wide variety of I/O signaling standards. In addition to the internal supply voltage (V_{CCINT} = 1.5V), output driver supply voltage (V_{CCO}) is dependent on the I/O standard (see Table 1 and Table 2). An auxiliary supply voltage (V_{CCAUX} = 3.3 V) is required, regardless of the I/O standard used. For exact supply voltage absolute maximum ratings, see DC Input and Output Levels in Module 3.

All of the user IOBs have fixed-clamp diodes to V_{CCO} and to ground. As outputs, these IOBs are not compatible or compliant with 5V I/O standards. As inputs, these IOBs are not normally 5V tolerant, but can be used with 5V I/O standards when external current-limiting resistors are used. For more details, see the "5V Tolerant I/Os" Tech Topic at www.xilinx.com.

Table 3 lists supported I/O standards with Digitally Controlled Impedance. See Digitally Controlled Impedance (DCI), page 8.

Notes:

1. V_{CCO} of GTL or GTLP should not be lower than the termination voltage or the voltage seen at the I/O pad. Example: If the pin High level is 1.5V, connect V_{CCO} to 1.5V.
2. SSTL18_I is not a JEDEC-supported standard.
3. N/R = no requirement.

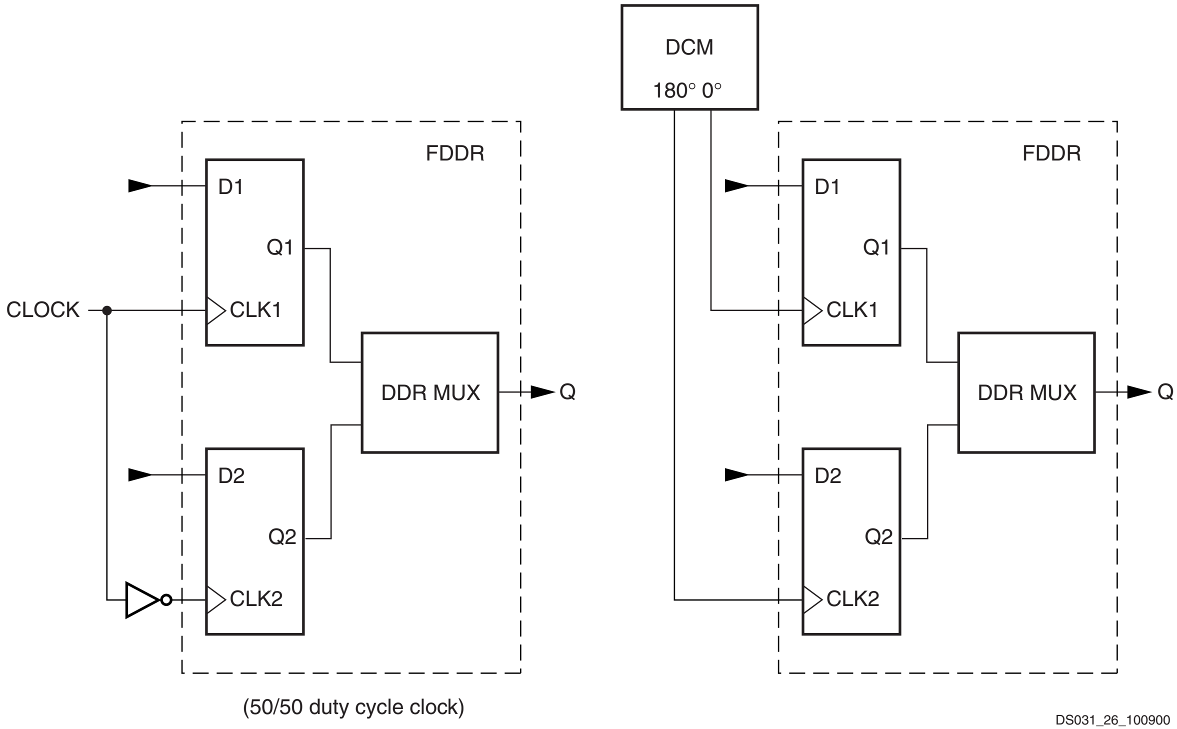

Figure 3: **Double Data Rate Registers**

The DDR mechanism shown in Figure 3 can be used to mirror a copy of the clock on the output. This is useful for propagating a clock along the data that has an identical delay. It is also useful for multiple clock generation, where there is a unique clock driver for every clock load. Virtex-II devices can produce many copies of a clock with very little skew.

Each group of two registers has a clock enable signal (ICE for the input registers, OCE for the output registers, and TCE for the 3-state registers). The clock enable signals are active High by default. If left unconnected, the clock enable for that storage element defaults to the active state.

Each IOB block has common synchronous or asynchronous set and reset (SR and REV signals).

SR forces the storage element into the state specified by the SRHIGH or SRLOW attribute. SRHIGH forces a logic “1”. SRLOW forces a logic “0”. When SR is used, a second input (REV) forces the storage element into the opposite state. The reset condition predominates over the set condition. The initial state after configuration or global initialization state is defined by a separate INIT0 and INIT1 attribute. By default, the SRLOW attribute forces INIT0, and the SRHIGH attribute forces INIT1.

For each storage element, the SRHIGH, SRLOW, INIT0, and INIT1 attributes are independent. Synchronous or asynchronous set / reset is consistent in an IOB block.

All the control signals have independent polarity. Any inverter placed on a control input is automatically absorbed.

Each register or latch (independent of all other registers or latches) (see Figure 4) can be configured as follows:

- No set or reset
- Synchronous set
- Synchronous reset
- Synchronous set and reset
- Asynchronous set (preset)
- Asynchronous reset (clear)
- Asynchronous set and reset (preset and clear)

The synchronous reset overrides a set, and an asynchronous clear overrides a preset.

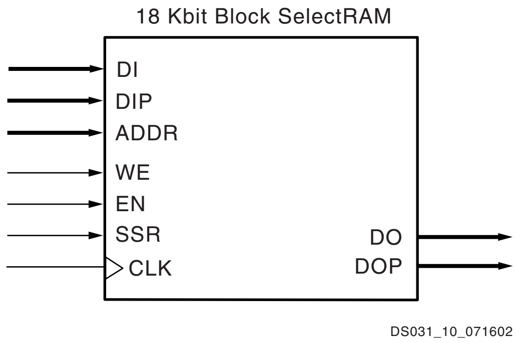

Figure 29: **18 Kbit Block SelectRAM Memory in Single-Port Mode**

Dual-Port Configuration

As a dual-port RAM, each port of block SelectRAM has access to a common 18 Kbit memory resource. These are fully synchronous ports with independent control signals for each port. The data widths of the two ports can be configured independently, providing built-in bus-width conversion.

Table 15 illustrates the different configurations available on ports A and B.

If both ports are configured in either 2K x 9-bit, 1K x 18-bit, or 512 x 36-bit configurations, the 18 Kbit block is accessible from port A or B. If both ports are configured in either 16K x 1-bit, 8K x 2-bit. or 4K x 4-bit configurations, the 16 K-bit block is accessible from Port A or Port B. All other configurations result in one port having access to an 18 Kbit memory block and the other port having access to a 16 K-bit subset of the memory block equal to 16 Kbits.

Date	Version	Revision
07/16/02	2.0	• Updated compatible input standards listed in Table 6.
09/26/02	2.1	• Changed number of resources available to the XC2V40 device in Table 13. • Clarified Power On Reset information under Configuration Sequence.
12/06/02	2.1.1	• Cosmetic edits.
05/07/03	2.1.2	• Added qualification note to Figure 13, page 11. • Corrected sentence in section Input/Output Individual Options, page 4, to read "The optional weak-keeper circuit is connected to each *user I/O pad*." • Corrected typographical errors in Table 3 for names of HSTL_[x]_DCI_18 standards.
06/19/03	2.2	• Removed Compatible Output Standards and Compatible Input Standards tables. • Added new Table 5, Summary of Voltage Supply Requirements for All Input and Output Standards. This table replaces deleted I/O standards tables. • Added section Rules for Combining I/O Standards in the Same Bank, page 6.
08/01/03	3.0	All Virtex-II devices and speed grades now Production. See Table 13, Module 3.
10/14/03	3.1	• Added section Local Clocking, page 29. • Table 1, page 1: - Added SSTL18_I and SSTL18_II. - Corrected names of 1.8V HSTL_I-IV standards to "HSTL_I-IV_18". - Corrected Input V_{REF} for HSTL_III-IV_18 from 1.08V to 1.1V. - Changed "N/A" to "N/R" (no requirement). • Table 2, page 2: - Changed "N/A" to "N/R" (no requirement). • Table 3, page 2: - Added SSTL18_I_DCI, SSTL18_II_DCI, LVDS_33_DCI, LVDSEXT_33_DCI, LVDS_25_DCI, and LVDSEXT_25_DCI. - Corrected Input V_{REF} for HSTL_III-IV_18 from 1.08V to 1.1V. • Sections Slave-Serial Mode and Master-Serial Mode, page 36: Changed "rising" to "falling" edge with respect to DOUT. • Added verbiage to section Bitstream Encryption, page 38: "For devices that support this feature, please contact your sales representative for specific ordering part number."
03/29/04	3.2	• Table 2, page 2, and Table 5, page 7: Removed LVDS_33_DCI and LVDSEXT_33_DCI from tables. • Table 26, page 37: Updated bitstream lengths. • Section BUFGMUX, page 29: Corrected the definition of the "presently selected clock" to be I0 or I1. Corrected signal names in Figure 44 and associated text from CLK0 and CLK1 to I0 and I1. • Recompiled for backward compatibility with Acrobat 4 and above.
06/24/04	3.3	• Table 1, page 1: Added example to Footnote (1) regarding V_{CCO} rules for GTL and GTLP. • Added reference to Pb-free package types in Figure 7, page 6.
03/01/05	3.4	• Reassigned heading hierarchies for better agreement with content. • Table 2: Corrected V_{OD} output voltages. • Table 26: Updated bitstream lengths.
11/05/07	3.5	• Updated copyright statement and legal disclaimer. • Boundary-Scan (JTAG, IEEE 1532) Mode, page 37: Updated IEEE 1149.1 compliance statement.

Extended LVDS DC Specifications (LVDSEXT_33 & LVDSEXT_25)

LVPECL DC Specifications

These values are valid when driving a 100 Ω differential load only, i.e., a 100 Ω resistor between the two receiver pins. The V_{OH} levels are 200 mV below standard LVPECL levels and are compatible with devices tolerant of lower common-mode ranges. Table 10 summarizes the DC output specifications of LVPECL. For more information on using LVPECL, see the *Virtex-II User Guide*.

Virtex-II Device/Package Combinations and Maximum I/Os Available

Wire-bond and flip-chip packages are available. Table 1 and Table 2 show the maximum number of user I/Os possible in wire-bond and flip-chip packages, respectively.

Table 3 shows the number of user I/Os available for all device/package combinations.

- CS denotes wire-bond chip-scale ball grid array (BGA) (0.80 mm pitch).
- CSG denotes Pb-free wire-bond chip-scale ball grid array (BGA) (0.80 mm pitch).
- FG denotes wire-bond fine-pitch BGA (1.00 mm pitch).
- FGG denotes Pb-free wire-bond fine-pitch BGA (1.00 mm pitch).
- BG denotes standard BGA (1.27 mm pitch).
- BGG denotes Pb-free standard BGA (1.27 mm pitch).
- FF denotes flip-chip fine-pitch BGA (1.00 mm pitch).
- BF denotes flip-chip BGA (1.27 mm pitch).

The number of I/Os per package include all user I/Os except the 15 control pins (CCLK, DONE, M0, M1, M2, PROG_B, PWRDWN_B, TCK, TDI, TDO, TMS, HSWAP_EN, DXN, DXP, AND RSVD).

Virtex-II Pin Definitions

This section describes the pinouts for Virtex-II devices in the following packages:

- CS144: wire-bond chip-scale ball grid array (BGA) of 0.80 mm pitch
- FG256, FG456, and FG676: wire-bond fine-pitch BGA of 1.00 mm pitch
- FF896, FF1152, FF1517: flip-chip fine-pitch BGA of 1.00 mm pitch
- BG575 and BG728: wire-bond BGA of 1.27 mm pitch
- BF957: flip-chip BGA of 1.27 mm pitch

All of the devices supported in a particular package are pinout compatible and are listed in the same table (one table per package). In addition, the FG456 and FG676 packages are compatible, as are the FF896 and FF1152 packages. Pins that are not available for the smallest devices are listed in right-hand columns.

Each device is split into eight I/O banks to allow for flexibility in the choice of I/O standards (see the Virtex-II *Data Sheet*). Global pins, including JTAG, configuration, and power/ground pins, are listed at the end of each table. Table 4 provides definitions for all pin types.

The FG256 pinouts (Table 6) is included as an example. All Virtex-II pinout tables are available on the distribution CD-ROM, or on the web (at **http://www.xilinx.com**).

BG575/BGG575 Standard BGA Package

As shown in Table 9, XC2V1000, XC2V1500, and XC2V2000 Virtex-II devices are available in the BG575/BGG575 BGA package. Pins in the XC2V1000, XC2V1500, and XC2V2000 devices are the same, except for the pin differences in the XC2V1000 and XC2V1500 devices shown in the No Connect columns. Following this table are the BG575/BGG575 Standard BGA Package Specifications (1.27mm pitch).
