Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	2688
Number of Logic Elements/Cells	-
Total RAM Bits	1032192
Number of I/O	624
Number of Gates	2000000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)

Revision History

This section records the change history for this module of the data sheet.

Date	Version	Revision
11/07/00	1.0	Early access draft.
12/06/00	1.1	Initial release.
01/15/01	1.2	Added values to the tables in the Virtex-II Performance Characteristics and Virtex-II Switching Characteristics sections.
01/25/01	1.3	The data sheet was divided into four modules (per the current style standard).
04/02/01	1.5	Skipped v1.4 to sync up modules. Reverted to traditional double-column format.
07/30/01	1.6	Made minor changes to items listed under Summary of Virtex-II™ Features.
10/02/01	1.7	Minor edits.
07/16/02	1.8	Updated Virtex-II Device/Package Combinations shown in Table 6.
09/26/02	1.9	Updated Table 2 and Table 6 to reflect supported Virtex-II Device/Package Combinations.
08/01/03	2.0	All Virtex-II devices and speed grades now Production. See Table 13, Module 3.
03/29/04	2.0.1	Recompiled for backward compatibility with Acrobat 4 and above. No content changes.
06/24/04	3.3	Added references to available Pb-free wire-bond packages. (Revision number advanced to level of complete data sheet.)
03/01/05	3.4	*No changes in Module 1 for this revision.*
11/05/07	3.5	Updated copyright notice and legal disclaimer.

Virtex-II Data Sheet

The Virtex-II Data Sheet contains the following modules:

- Virtex-II Platform FPGAs: Introduction and Overview (Module 1)
- Virtex-II Platform FPGAs: Functional Description (Module 2)
- Virtex-II Platform FPGAs: DC and Switching Characteristics (Module 3)
- Virtex-II Platform FPGAs: Pinout Information (Module 4)

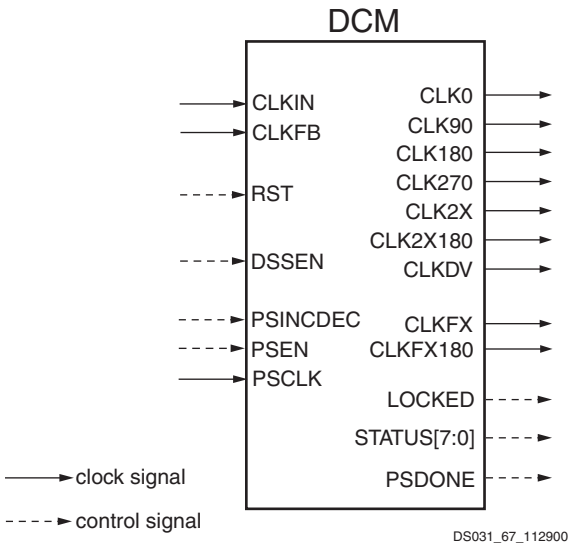

Figure 45: **Digital Clock Manager**

The DCM can be configured to delay the completion of the Virtex-II configuration process until after the DCM has achieved lock. This guarantees that the chip does not begin operating until after the system clocks generated by the DCM have stabilized.

The DCM has the following general control signals:

- RST input pin: resets the entire DCM
- LOCKED output pin: asserted High when all enabled DCM circuits have locked.
- STATUS output pins (active High): shown in Table 21.

Table 21: **DCM Status Pins**

Status Pin	Function
0	Phase Shift Overflow
1	CLKIN Stopped
2	CLKFX Stopped
3	N/A
4	N/A
5	N/A
6	N/A
7	N/A

Clock De-Skew

The DCM de-skews the output clocks relative to the input clock by automatically adjusting a digital delay line. Additional delay is introduced so that clock edges arrive at internal registers and block RAMs simultaneously with the clock edges arriving at the input clock pad. Alternatively, external clocks, which are also de-skewed relative to the input clock, can be generated for board-level routing. All DCM output clocks are phase-aligned to CLK0 and, therefore, are also phase-aligned to the input clock.

To achieve clock de-skew, the CLKFB input must be connected, and its source must be either CLK0 or CLK2X. Note that CLKFB must always be connected, unless only the CLKFX or CLKFX180 outputs are used and de-skew is not required.

Frequency Synthesis

The DCM provides flexible methods for generating new clock frequencies. Each method has a different operating frequency range and different AC characteristics. The CLK2X and CLK2X180 outputs double the clock frequency. The CLKDV output creates divided output clocks with division options of 1.5, 2, 2.5, 3, 3.5, 4, 4.5, 5, 5.5, 6, 6.5, 7, 7.5, 8, 9, 10, 11, 12, 13, 14, 15, and 16.

The CLKFX and CLKFX180 outputs can be used to produce clocks at the following frequency:

$$FREQ_{CLKFX} = (M/D) * FREQ_{CLKIN}$$

where M and D are two integers. Specifications for M and D are provided under DCM Timing Parameters in Module 3. By default, M=4 and D=1, which results in a clock output frequency four times faster than the clock input frequency (CLKIN).

CLK2X180 is phase shifted 180 degrees relative to CLK2X. CLKFX180 is phase shifted 180 degrees relative to CLKFX. All frequency synthesis outputs automatically have 50/50 duty cycles (with the exception of the CLKDV output when performing a non-integer divide in high-frequency mode).

Note that CLK2X and CLK2X180 are not available in high-frequency mode.

Phase Shifting

The DCM provides additional control over clock skew through either coarse or fine-grained phase shifting. The CLK0, CLK90, CLK180, and CLK270 outputs are each phase shifted by ¼ of the input clock period relative to each other, providing coarse phase control. Note that CLK90 and CLK270 are not available in high-frequency mode.

Fine-phase adjustment affects all nine DCM output clocks. When activated, the phase shift between the rising edges of CLKIN and CLKFB is a specified fraction of the input clock period.

In variable mode, the PHASE_SHIFT value can also be dynamically incremented or decremented as determined by PSINCDEC synchronously to PSCLK, when the PSEN input is active. Figure 46 illustrates the effects of fine-phase shifting. For more information on DCM features, see the Virtex-II *User Guide*.

Notes:
1. IFF = Input Flip-Flop or Latch
2. Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.
3. These values are parametrically measured.

Notes:
1. "DLL outputs" is used here to describe the outputs: CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, and CLKDV.
2. If both DLL and CLKFX outputs are used, follow the more restrictive specification.
3. If DCM phase shift feature is used and CLKIN frequency > 200 Mhz, CLKIN duty cycle must be within ±5% (45/55 to 55/45).
