### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

|                                |                                                                                                                                         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|
| Product Status                 | Obsolete                                                                                                                                |
| Number of LABs/CLBs            | 3584                                                                                                                                    |
| Number of Logic Elements/Cells | -                                                                                                                                       |

- HSTL (Class I, II, III, and IV)
- SSTL (3.3V and 2.5V, Class I and II)
- AGP-2X

The digitally controlled impedance (DCI) I/O feature automatically provides on-chip termination for each I/O element.

The IOB elements also support the following differential signaling I/O standards:

- LVDS
- BLVDS (Bus LVDS)
- ULVDS
- LDT
- LVPECL

Two adjacent pads are used for each differential pair. Two or four IOB blocks connect to one switch matrix to access the routing resources.

### Configurable Logic Blocks (CLBs)

CLB resources include four slices and two 3-state buffers. Each slice is equivalent and contains:

- Two function generators (F & G)
- Two storage elements
- Arithmetic logic gates
- Large multiplexers
- Wide function capability
- Fast carry look-ahead chain
- Horizontal cascade chain (OR gate)

The function generators F & G are configurable as 4-input look-up tables (LUTs), as 16-bit shift registers, or as 16-bit distributed SelectRAM memory.

In addition, the two storage elements are either edge-triggered D-type flip-flops or level-sensitive latches.

Each CLB has internal fast interconnect and connects to a switch matrix to access general routing resources.

### Block SelectRAM Memory

The block SelectRAM memory resources are 18 Kb of dual-port RAM, programmable from 16K x 1 bit to 512 x 36 bits, in various depth and width configurations. Each port is totally synchronous and independent, offering three "read-during-write" modes. Block SelectRAM memory is cascadable to implement large embedded storage blocks. Supported memory configurations for dual-port and single-port modes are shown in [Table 3](#).

Table 3: Dual-Port And Single-Port Configurations

|             |               |
|-------------|---------------|
| 16K x 1 bit | 2K x 9 bits   |
| 8K x 2 bits | 1K x 18 bits  |
| 4K x 4 bits | 512 x 36 bits |

A multiplier block is associated with each SelectRAM memory block. The multiplier block is a dedicated 18 x 18-bit multiplier and is optimized for operations based on the block SelectRAM content on one port. The 18 x 18 multiplier can be used independently of the block SelectRAM resource. Read/multiply/accumulate operations and DSP filter structures are extremely efficient.

Both the SelectRAM memory and the multiplier resource are connected to four switch matrices to access the general routing resources.

### Global Clocking

The DCM and global clock multiplexer buffers provide a complete solution for designing high-speed clocking schemes.

Up to 12 DCM blocks are available. To generate de-skewed internal or external clocks, each DCM can be used to eliminate clock distribution delay. The DCM also provides 90-, 180-, and 270-degree phase-shifted versions of its output clocks. Fine-grained phase shifting offers high-resolution phase adjustments in increments of 1/256 of the clock period. Very flexible frequency synthesis provides a clock output frequency equal to any M/D ratio of the input clock frequency, where M and D are two integers. For the exact timing parameters, see [Virtex-II Electrical Characteristics](#).

Virtex-II devices have 16 global clock MUX buffers, with up to eight clock nets per quadrant. Each global clock MUX buffer can select one of the two clock inputs and switch glitch-free from one clock to the other. Each DCM block is able to drive up to four of the 16 global clock MUX buffers.

### Routing Resources

The IOB, CLB, block SelectRAM, multiplier, and DCM elements all use the same interconnect scheme and the same access to the global routing matrix. Timing models are shared, greatly improving the predictability of the performance of high-speed designs.

There are a total of 16 global clock lines, with eight available per quadrant. In addition, 24 vertical and horizontal long lines per row or column as well as massive secondary and local routing resources provide fast interconnect. Virtex-II buffered interconnects are relatively unaffected by net fanout and the interconnect layout is designed to minimize crosstalk.

Horizontal and vertical routing resources for each row or column include:

- 24 long lines
- 120 hex lines
- 40 double lines
- 16 direct connect lines (total in all four directions)

## IOB Output Switching Characteristics

Output delays terminating at a pad are specified for LVTTTL with 12 mA drive and fast slew rate. For other standards, adjust the delays with the values shown in [IOB Output Switching Characteristics Standard Adjustments, page 14](#).

Table 16: IOB Output Switching Characteristics

|                                                                    |                                            | Speed Grade |            |            |         |
|--------------------------------------------------------------------|--------------------------------------------|-------------|------------|------------|---------|
| Description                                                        | Symbol                                     | -6          | -5         | -4         | Units   |
| Propagation Delays                                                 |                                            |             |            |            |         |

### Notes:

1. The 3-state turn-off delays should not be adjusted.

## IOB Output Switching Characteristics Standard Adjustments

**Table 17** gives all standard-specific adjustments for output delays terminating at pads, based on standard capacitive load,  $C_{REF}$ . Output delays terminating at a pad are specified for LVTTTL with 12 mA drive and fast slew rate. For other standards, adjust the delays by the values shown.

**Table 17: IOB Output Switching Characteristics Standard Adjustments**

| Description                                                  | IOSTANDARD Attribute | Timing Parameter     | Speed Grade |       |       | Units |
|--------------------------------------------------------------|----------------------|----------------------|-------------|-------|-------|-------|
|                                                              |                      |                      | -6          | -5    | -4    |       |
| LVTTTL (Low-Voltage Transistor-Transistor Logic), Slow, 2 mA | LVTTTL_S2            | $T_{OLVTTTL\_S2}$    | 9.42        | 9.71  | 10.68 | ns    |
| LVTTTL, Slow, 4 mA                                           | LVTTTL_S4            | $T_{OLVTTTL\_S4}$    | 5.77        | 5.95  | 6.55  | ns    |
| LVTTTL, Slow, 6 mA                                           | LVTTTL_S6            | $T_{OLVTTTL\_S6}$    | 4.11        | 4.24  | 4.66  | ns    |
| LVTTTL, Slow, 8 mA                                           | LVTTTL_S8            | $T_{OLVTTTL\_S8}$    | 2.87        | 2.96  | 3.26  | ns    |
| LVTTTL, Slow, 12 mA                                          | LVTTTL_S12           | $T_{OLVTTTL\_S12}$   | 2.32        | 2.39  | 2.63  | ns    |

# FG456/FGG456 Fine-Pitch BGA Package Specifications (1.00mm pitch)

## NOTES:

1. ALL DIMENSIONS AND TOLERANCES CONFORM TO ANSI Y14.5M-1994
2. SYMBOL 'M' IS THE BALL MATRIX SIZE.
3. NOMINAL 'A' DIMENSION FOR 2-LAYER IS 2.03mm AND FOR 4-LAYER IS 2.20mm.
4. CONFORMS TO JEDEC MS-034-AAJ-1 (DEPOPULATED)

## 456-BALL FINE PITCH BGA (FG456/FGG456)

## FF896 Flip-Chip Fine-Pitch BGA Package

As shown in Table 11, XC2V1000, XC2V1500, and XC2V2000 Virtex-II devices are available in the FF896 flip-chip fine-pitch BGA package. Pins in the XC2V1000, XC2V1500, and XC2V2000 devices are the same, except for the pin differences in the XC2V1000 and XC2V1500 devices shown in the No Connect columns. Following this table are the **FF896 Flip-Chip Fine-Pitch BGA Package Specifications (1.00mm pitch)**.

Table 11: FF896 BGA — XC2V1000, XC2V1500, and XC2V2000

| Bank | Pin Description  | Pin Number | No Connect in the XC2V1000 | No Connect in the XC2V1500 |
|------|------------------|------------|----------------------------|----------------------------|
