Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

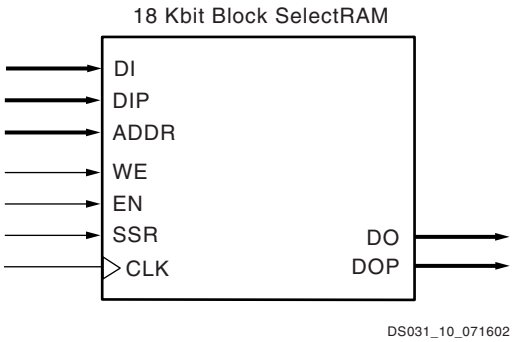

Figure 29: **18 Kbit Block SelectRAM Memory in Single-Port Mode**

Dual-Port Configuration

As a dual-port RAM, each port of block SelectRAM has access to a common 18 Kbit memory resource. These are fully synchronous ports with independent control signals for each port. The data widths of the two ports can be configured independently, providing built-in bus-width conversion.

Table 15 illustrates the different configurations available on ports A and B.

If both ports are configured in either 2K x 9-bit, 1K x 18-bit, or 512 x 36-bit configurations, the 18 Kbit block is accessible from port A or B. If both ports are configured in either 16K x 1-bit, 8K x 2-bit. or 4K x 4-bit configurations, the 16 K-bit block is accessible from Port A or Port B. All other configurations result in one port having access to an 18 Kbit memory block and the other port having access to a 16 K-bit subset of the memory block equal to 16 Kbits.

Table 15: **Dual-Port Mode Configurations**

Port A	16K x 1	16K x 1	16K x 1	16K x 1	16K x 1	16K x 1
Port B	16K x 1	8K x 2	4K x 4	2K x 9	1K x 18	512 x 36

Port B	2K x 9	1K x 18	512 x 36			
Port A	1K x 18	1K x 18				
Port B	1K x 18	512 x 36				
Port A	512 x 36					
Port B	512 x 36					

3. "NO_CHANGE"

The "NO_CHANGE" option maintains the content of the output registers, regardless of the write operation. The clock edge during the write mode has no effect on the content of the data output register DO. When the port is configured as "NO_CHANGE", only a read operation loads a new value in the output register DO, as shown in Figure 33.

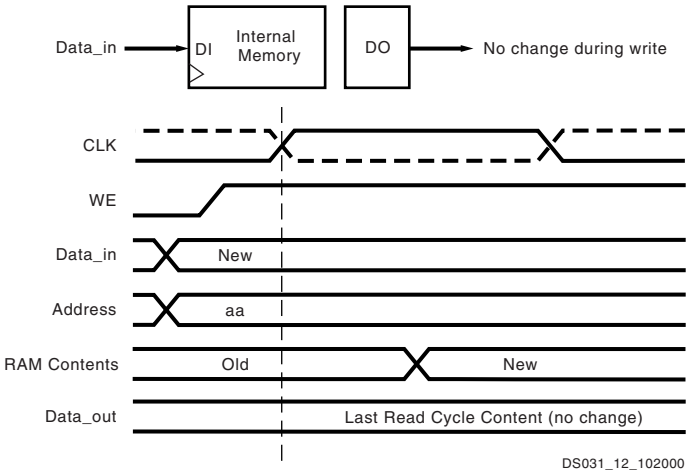

Figure 33: **NO_CHANGE Mode**

Control Pins and Attributes

Virtex-II SelectRAM memory has two independent ports with the control signals described in Table 17. All control inputs including the clock have an optional inversion.

Table 17: **Control Functions**

Control Signal	Function
CLK	Read and Write Clock
EN	Enable affects Read, Write, Set, Reset
WE	Write Enable
SSR	Set DO register to SRVAL (attribute)

Initial memory content is determined by the INIT_xx attributes. Separate attributes determine the output register value after device configuration (INIT) and SSR is asserted (SRVAL). Both attributes (INIT_B and SRVAL) are available for each port when a block SelectRAM resource is configured as dual-port RAM.

Locations

Virtex-II SelectRAM memory blocks are located in either four or six columns. The number of blocks per column depends of the device array size and is equivalent to the number of CLBs in a column divided by four. Column locations are shown in Table 18.

Table 18: **SelectRAM Memory Floor Plan**

ments to begin changing state in response to the logic and the user clock.

The relative timing of these events can be changed via configuration options in software. In addition, the GTS and GWE events can be made dependent on the DONE pins of multiple devices all going High, forcing the devices to start synchronously. The sequence can also be paused at any stage, until lock has been achieved on any or all DCMs, as well as the DCI.

Readback

In this mode, configuration data from the Virtex-II FPGA device can be read back. Readback is supported only in the SelectMAP (master and slave) and Boundary-Scan mode.

Along with the configuration data, it is possible to read back the contents of all registers, distributed SelectRAM, and block RAM resources. This capability is used for real-time debugging. For more detailed configuration information, see the Virtex-II *Platform FPGA User Guide.*

Bitstream Encryption

Virtex-II devices have an on-chip decryptor using one or two sets of three keys for triple-key Data Encryption Standard (DES) operation. Xilinx software tools offer an optional encryption of the configuration data (bitstream) with a triple-key DES determined by the designer.

The keys are stored in the FPGA by JTAG instruction and retained by a battery connected to the V_{BATT} pin, when the device is not powered. Virtex-II devices can be configured with the corresponding encrypted bitstream, using any of the configuration modes described previously.

A detailed description of how to use bitstream encryption is provided in the *Virtex-II Platform FPGA User Guide*. For devices that support this feature, please contact your sales representative for specific ordering part number.

Partial Reconfiguration

Partial reconfiguration of Virtex-II devices can be accomplished in either Slave SelectMAP mode or Boundary-Scan mode. Instead of resetting the chip and doing a full configuration, new data is loaded into a specified area of the chip, while the rest of the chip remains in operation. Data is loaded on a column basis, with the smallest load unit being a configuration “frame” of the bitstream (device size dependent).

Partial reconfiguration is useful for applications that require different designs to be loaded into the same area of a chip, or that require the ability to change portions of a design without having to reset or reconfigure the entire chip.

Virtex-II Electrical Characteristics

Virtex-II™ devices are provided in -6, -5, and -4 speed grades, with -6 having the highest performance.

Virtex-II DC and AC characteristics are specified for both commercial and industrial grades. Except the operating temperature range or unless otherwise noted, all the DC and AC electrical parameters are the same for a particular speed grade (that is, the timing characteristics of a -4 speed grade industrial device are the same as for a -4 speed grade commercial device). However, only selected speed grades and/or devices might be available in the industrial range.

All supply voltage and junction temperature specifications are representative of worst-case conditions. The parameters included are common to popular designs and typical applications. Contact Xilinx for design considerations requiring more detailed information.

All specifications are subject to change without notice.

Notes:
1. Stresses beyond those listed under Absolute Maximum Ratings might cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time might affect device reliability.
2. For soldering guidelines and thermal considerations, see the **Device Packaging and Thermal Characteristics Guide** information on the Xilinx website.
3. Inputs configured as PCI are fully PCI compliant. This statement takes precedence over any specification that would imply that the device is not PCI compliant.

	Description	Figure References	Symbol	Value	Units
CCLK	DIN setup/hold, slave mode (Figure 3)	1/2	T_{DCC}/T_{CCD}	5.0/0.0	ns, min
	DIN setup/hold, master mode (Figure 4)	1/2	T_{DSCK}/T_{CKDS}	5.0/0.0	ns, min
	DOUT	3	T_{CCO}	12.0	ns, max
	High time	4	T_{CCH}	5.0	ns, min
	Low time	5	T_{CCL}	5.0	ns, min
	Maximum start-up frequency		$F_{CC\_STARTUP}$	50	MHz, max
	Maximum frequency		F_{CC_SERIAL}	66(1)	MHz, max
	Frequency tolerance, master mode with respect to nominal			+45% –30%	

Notes:
1. If no provision is made in the design to adjust the frequency of CCLK, F_{CC_SERIAL} should not exceed $F_{CC\_STARTUP}$.

Description	Symbol	Constraints	Speed Grade			Units
			-6	-5	-4	
Phase Offset Between CLKIN and CLKFB						
CLKIN/CLKFB	CLKIN_CLKFB_PHASE		±50	±50	±50	ps

CLKFX outputs	CLKOUT_DUTY_CYCLE_FX		±100	±100	±100	ps

Notes:
1. "DLL outputs" is used here to describe the outputs: CLK0, CLK90, CLK180, CLK270, CLK2X, CLK2X180, and CLKDV.
2. CLKOUT_DUTY_CYCLE_DLL applies to the 1X clock outputs (CLK0, CLK90, CLK180, and CLK270) only if DUTY_CYCLE_CORRECTION = TRUE.
3. Specification also applies to PSCLK.
