Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	80C51
Core Size	8-Bit
Speed	30/20MHz
Connectivity	UART/USART
Peripherals	POR
Number of I/O	32
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	128 x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-LQFP
Supplier Device Package	44-VQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/atmel/at80c31x2-rltul

4. SFR Mapping

The Special Function Registers (SFRs) of the TS80C31X2 fall into the following categories:

- C51 core registers: ACC, B, DPH, DPL, PSW, SP, AUXR1
- I/O port registers: P0, P1, P2, P3
- Timer registers: TCON, TH0, TH1, TMOD, TL0, TL1
- Serial I/O port registers: SADDR, SADEN, SBUF, SCON
- Power and clock control registers: PCON
- Interrupt system registers: IE, IP, IPH
- Others: CKCON

Table 4-1. All SFRs with their address and their reset value

Reserved

Mnemonic	Pin Number			Type	Name And Function
	DIL	LCC	VQFP 1.4		
V_{SS}	20	22	16	I	**Ground:** 0V reference
Vss1		1	39	I	Optional Ground: **Contact the Sales Office for ground connection.**
V_{CC}	40	44	38	I	**Power Supply:** This is the power supply voltage for normal, idle and power-down operation
P0.0-P0.7	39-32	43-36	37-30	I/O	**Port 0**: Port 0 is an open-drain, bidirectional I/O port. Port 0 pins that have 1s written to them float and can be used as high impedance inputs. Port 0 pins must be polarized to Vcc or Vss in order to prevent any parasitic current consumption. Port 0 is also the multiplexed low-order address and data bus during access to external program and data memory. In this application, it uses strong internal pull-up when emitting 1s.
P1.0-P1.7	1-8	2-9	40-44 1-3	I/O	Port 1: Port 1 is an 8-bit bidirectional I/O port with internal pull-ups. Port 1 pins that have 1s written to them are pulled high by the internal pull-ups and can be used as inputs. As inputs, Port 1 pins that are externally pulled low will source current because of the internal pull-ups.
P2.0-P2.7	21-28	24-31	18-25	I/O	**Port 2**: Port 2 is an 8-bit bidirectional I/O port with internal pull-ups. Port 2 pins that have 1s written to them are pulled high by the internal pull-ups and can be used as inputs. As inputs, Port 2 pins that are externally pulled low will source current because of the internal pull-ups. Port 2 emits the high-order address byte during fetches from external program memory and during accesses to external data memory that use 16-bit addresses (MOVX @DPTR).In this application, it uses strong internal pull-ups emitting 1s. During accesses to external data memory that use 8-bit addresses (MOVX @Ri), port 2 emits the contents of the P2 SFR.
P3.0-P3.7	10-17	11, 13-19	5, 7-13	I/O	Port 3: Port 3 is an 8-bit bidirectional I/O port with internal pull-ups. Port 3 pins that have 1s written to them are pulled high by the internal pull-ups and can be used as inputs. As inputs, Port 3 pins that are externally pulled low will source current because of the internal pull-ups. Port 3 also serves the special features of the 80C51 family, as listed below.
	10	11	5	I	**RXD (P3.0):** Serial input port
	11	13	7	O	**TXD (P3.1):** Serial output port
	12	14	8	I	**$\overline{\text{INT0}}$ (P3.2):** External interrupt 0
	13	15	9	I	**$\overline{\text{INT1}}$ (P3.3):** External interrupt 1
	14	16	10	I	**T0 (P3.4):** Timer 0 external input
	15	17	11	I	**T1 (P3.5):** Timer 1 external input
	16	18	12	O	**$\overline{\text{WR}}$ (P3.6):** External data memory write strobe
	17	19	13	O	**$\overline{\text{RD}}$ (P3.7):** External data memory read strobe
Reset	9	10	4	I	**Reset:** A high on this pin for two machine cycles while the oscillator is running, resets the device. An internal diffused resistor to V_{SS} permits a power-on reset using only an external capacitor to V_{CC}.
ALE	30	33	27	O (I)	**Address Latch Enable:** Output pulse for latching the low byte of the address during an access to external memory. In normal operation, ALE is emitted at a constant rate of 1/6 (1/3 in X2 mode) the oscillator frequency, and can be used for external timing or clocking. Note that one ALE pulse is skipped during each access to external data memory.
PSEN	29	32	26	O	**Program Store ENable:** The read strobe to external program memory. When executing code from the external program memory, $\overline{\text{PSEN}}$ is activated twice each machine cycle, except that two $\overline{\text{PSEN}}$ activations are skipped during each access to external data memory. $\overline{\text{PSEN}}$ is not activated during fetches from internal program memory.

7. Dual Data Pointer Register Ddptr

The additional data pointer can be used to speed up code execution and reduce code size in a number of ways.

The dual DPTR structure is a way by which the chip will specify the address of an external data memory location. There are two 16-bit DPTR registers that address the external memory, and a single bit called
DPS = AUXR1/bit0 (See Table 5.) that allows the program code to switch between them (Refer to Figure 7-1).

Figure 7-1. Use of Dual Pointer

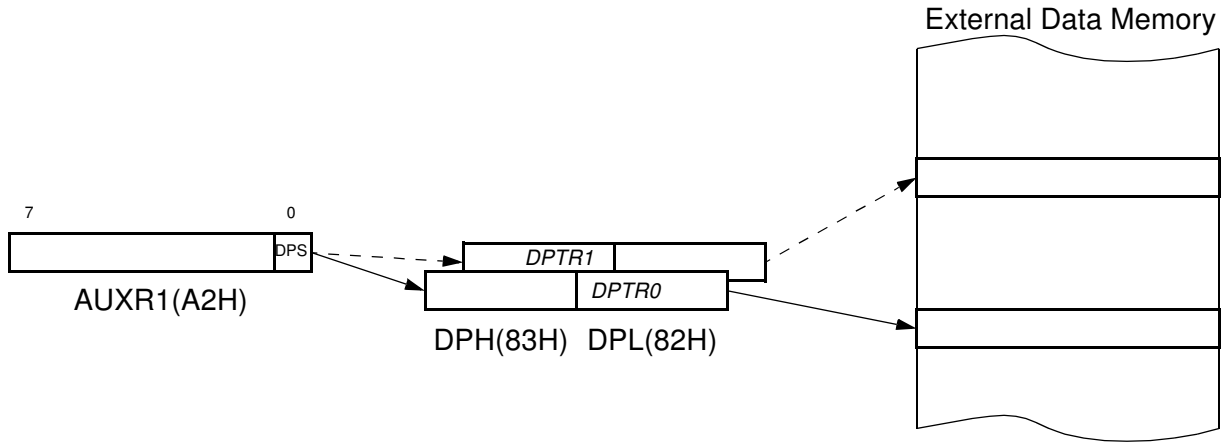

Table 7-1. AUXR1: Auxiliary Register 1

7	6	5	4	3	2	1	0
-	-3	-	-	-	-	-	DPS

Bit Number	Bit Mnemonic	Description
7	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
6	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
5	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
4	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
3	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
2	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
1	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
0	DPS	**Data Pointer Selection** Clear to select DPTR0. Set to select DPTR1.

Reset Value = XXXX XXX0
Not bit addressable

8. Application

Software can take advantage of the additional data pointers to both increase speed and reduce code size, for example, block operations (copy, compare, search ...) are well served by using one data pointer as a 'source' pointer and the other one as a "destination" pointer.

ASSEMBLY LANGUAGE

```
; Block move using dual data pointers
; Destroys DPTR0, DPTR1, A and PSW
; note: DPS exits opposite of entry state
; unless an extra INC AUXR1 is added
;
00A2                AUXR1 EQU 0A2H
;
0000 909000         MOV   DPTR,#SOURCE    ; address of SOURCE
0003 05A2           INC   AUXR1           ; switch data pointers
0005 90A000         MOV   DPTR,#DEST      ; address of DEST
0008                LOOP:
0008 05A2           INC   AUXR1           ; switch data pointers
000A E0             MOVX  A,@DPTR         ; get a byte from SOURCE
000B A3             INC   DPTR            ; increment SOURCE address
000C 05A2           INC   AUXR1           ; switch data pointers
000E F0             MOVX  @DPTR,A         ; write the byte to DEST
000F A3             INC   DPTR            ; increment DEST address
0010 70F6           JNZ   LOOP            ; check for 0 terminator
0012 05A2           INC   AUXR1           ; (optional) restore DPS
```

INC is a short (2 bytes) and fast (12 clocks) way to manipulate the DPS bit in the AUXR1 SFR. However, note that the INC instruction does not directly force the DPS bit to a particular state, but simply toggles it. In simple routines, such as the block move example, only the fact that DPS is toggled in the proper sequence matters, not its actual value. In other words, the block move routine works the same whether DPS is '0' or '1' on entry. Observe that without the last instruction (INC AUXR1), the routine will exit with DPS in the opposite state.

9. TS80C31X2 Serial I/O Port

The serial I/O port in the TS80C31X2 is compatible with the serial I/O port in the 80C31.
It provides both synchronous and asynchronous communication modes. It operates as an Universal Asynchronous Receiver and Transmitter (UART) in three full-duplex modes (Modes 1, 2 and 3). Asynchronous transmission and reception can occur simultaneously and at different baud rates

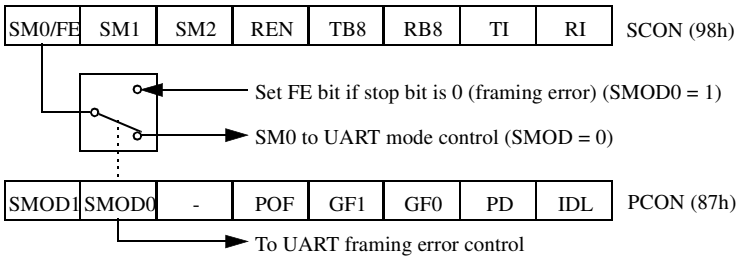
Serial I/O port includes the following enhancements:

- Framing error detection
- Automatic address recognition

9.1 Framing Error Detection

Framing bit error detection is provided for the three asynchronous modes (modes 1, 2 and 3). To enable the framing bit error detection feature, set SMOD0 bit in PCON register (See Figure 9-1).

Figure 9-1. Framing Error Block Diagram



When this feature is enabled, the receiver checks each incoming data frame for a valid stop bit. An invalid stop bit may result from noise on the serial lines or from simultaneous transmission by two CPUs. If a valid stop bit is not found, the Framing Error bit (FE) in SCON register (See Table 9-3.) bit is set.
Software may examine FE bit after each reception to check for data errors. Once set, only software or a reset can clear FE bit. Subsequently received frames with valid stop bits cannot clear FE bit. When FE feature is enabled, RI rises on stop bit instead of the last data bit (See Figure 9-2. and Figure 9-3.).

Figure 9-2. UART Timings in Mode 1

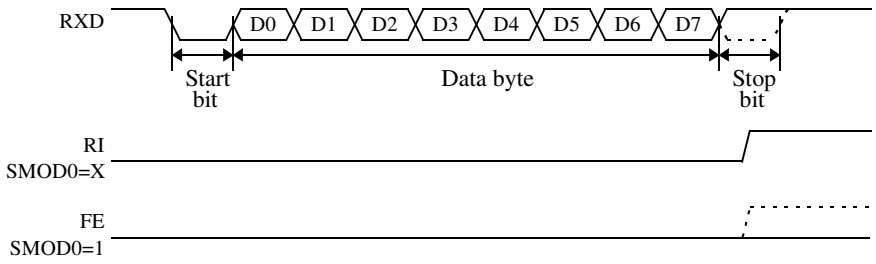


Figure 9-3. UART Timings in Modes 2 and 3

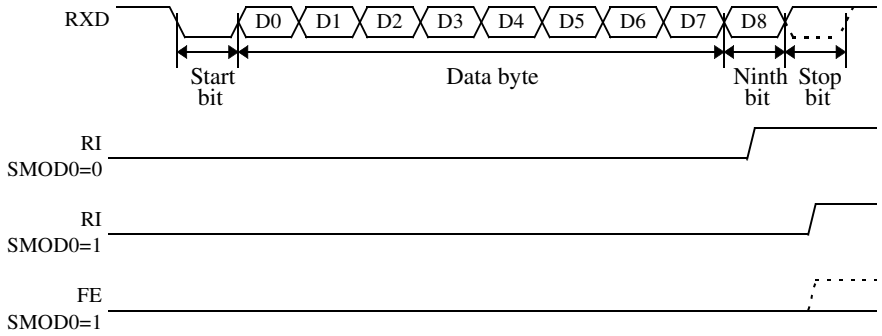


9.2 Automatic Address Recognition

The automatic address recognition feature is enabled when the multiprocessor communication feature is enabled (SM2 bit in SCON register is set).

Implemented in hardware, automatic address recognition enhances the multiprocessor communication feature by allowing the serial port to examine the address of each incoming command frame. Only when the serial port recognizes its own address, the receiver sets RI bit in SCON register to generate an interrupt. This ensures that the CPU is not interrupted by command frames addressed to other devices.

If desired, you may enable the automatic address recognition feature in mode 1. In this configuration, the stop bit takes the place of the ninth data bit. Bit RI is set only when the received command frame address matches the device's address and is terminated by a valid stop bit.

To support automatic address recognition, a device is identified by a given address and a broadcast address.

NOTE: The multiprocessor communication and automatic address recognition features cannot be enabled in mode 0 (i.e. setting SM2 bit in SCON register in mode 0 has no effect).

9.3 Given Address

Each device has an individual address that is specified in SADDR register; the SADEN register is a mask byte that contains don't-care bits (defined by zeros) to form the device's given address. The don't-care bits provide the flexibility to address one or more slaves at a time. The following example illustrates how a given address is formed.

To address a device by its individual address, the SADEN mask byte must be `1111 1111b`.

For example:

```
SADDR      0101 0110b
SADEN      1111 1100b
Given      0101 01XXb
```

The following is an example of how to use given addresses to address different slaves:

```
Slave A:   SADDR      1111 0001b
           SADEN      1111 1010b
           Given      1111 0X0Xb

Slave B:   SADDR      1111 0011b
           SADEN      1111 1001b
           Given      1111 0XX1b
```

```
Slave C:    SADDR       1111 0010b
            SADEN       1111 1101b
            Given       1111 00X1b
```

The SADEN byte is selected so that each slave may be addressed separately.
For slave A, bit 0 (the LSB) is a don't-care bit; for slaves B and C, bit 0 is a 1. To communicate with slave A only, the master must send an address where bit 0 is clear (e.g. 1111 0000b).
For slave A, bit 1 is a 1; for slaves B and C, bit 1 is a don't care bit. To communicate with slaves B and C, but not slave A, the master must send an address with bits 0 and 1 both set (e.g. 1111 0011b).
To communicate with slaves A, B and C, the master must send an address with bit 0 set, bit 1 clear, and bit 2 clear (e.g. 1111 0001b).

9.4 Broadcast Address

A broadcast address is formed from the logical OR of the SADDR and SADEN registers with zeros defined as don't-care bits, e.g.:

```
            SADDR             0101 0110b
            SADEN             1111 1100b
Broadcast =SADDR OR SADEN     1111 111Xb
```

The use of don't-care bits provides flexibility in defining the broadcast address, however in most applications, a broadcast address is FFh. The following is an example of using broadcast addresses:

```
Slave A:    SADDR       1111 0001b
            SADEN       1111 1010b
            Broadcast   1111 1X11b,

Slave B:    SADDR       1111 0011b
            SADEN       1111 1001b
            Broadcast   1111 1X11B,

Slave C:    SADDR=      1111 0010b
            SADEN       1111 1101b
            Broadcast   1111 1111b
```

For slaves A and B, bit 2 is a don't care bit; for slave C, bit 2 is set. To communicate with all of the slaves, the master must send an address FFh. To communicate with slaves A and B, but not slave C, the master can send and address FBh.

9.5 Reset Addresses

On reset, the SADDR and SADEN registers are initialized to 00h, i.e. the given and broadcast addresses are XXXX XXXXb (all don't-care bits). This ensures that the serial port will reply to any address, and so, that it is backwards compatible with the 80C51 microcontrollers that do not support automatic address recognition.

Table 9-1. SADEN - Slave Address Mask Register (B9h)

7	6	5	4	3	2	1	0

Reset Value = 0000 0000b
Not bit addressable

Table 9-2. SADDR - Slave Address Register (A9h)

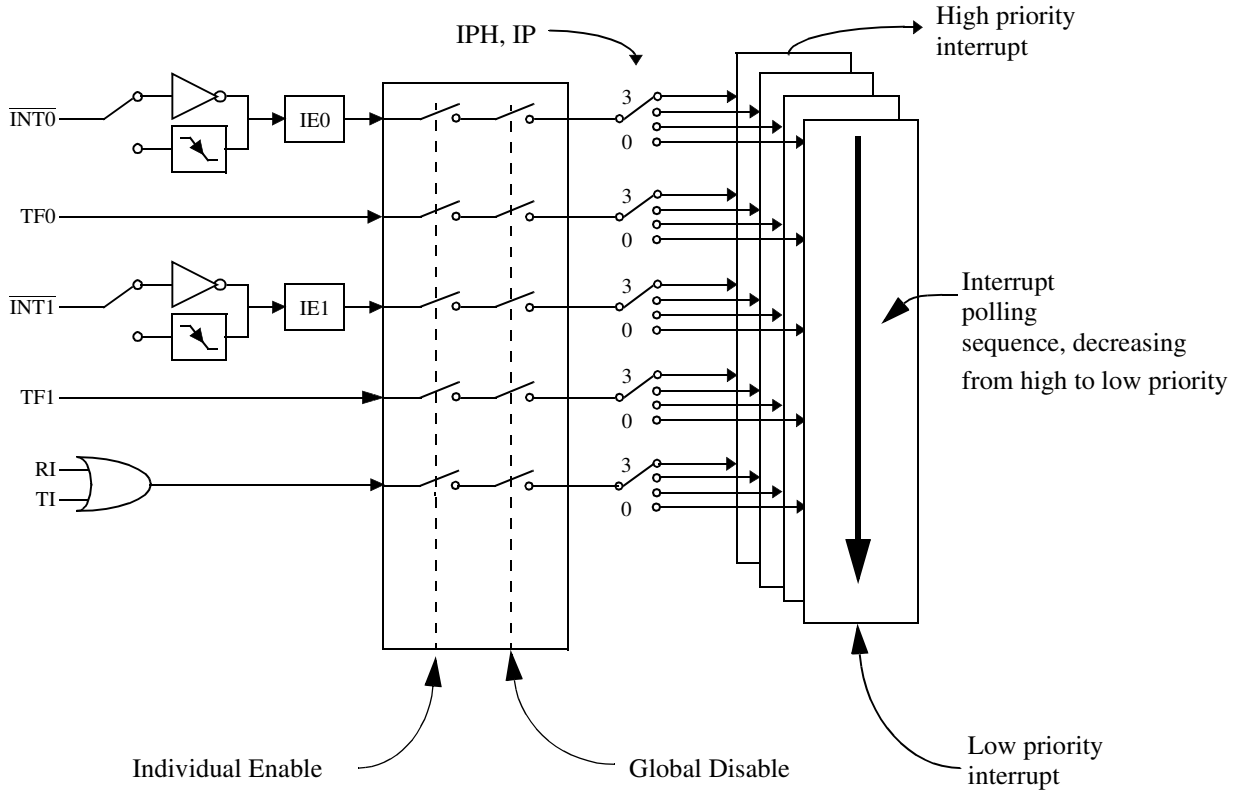
7	6	5	4	3	2	1	0

Reset Value = 0000 0000b
Not bit addressable

10. Interrupt System

The TS80C31X2 has a total of 5 interrupt vectors: two external interrupts ($\overline{INT0}$ and $\overline{INT1}$), two timer interrupts (timers 0 and 1) and the serial port interrupt. These interrupts are shown in Figure 10-1.

Figure 10-1. Interrupt Control System



Each of the interrupt sources can be individually enabled or disabled by setting or clearing a bit in the Interrupt Enable register (See Table 10-2.Table 10-3.). This register also contains a global disable bit, which must be cleared to disable all interrupts at once.

Each interrupt source can also be individually programmed to one out of four priority levels by setting or clearing a bit in the Interrupt Priority register (See Table 10-3.) and in the Interrupt Priority High register (See Table 10-4.). shows the bit values and priority levels associated with each combination.

Table 10-1. Priority Level Bit Values

IPH.x	IP.x	Interrupt Level Priority
0	0	0 (Lowest)
0	1	1
1	0	2
1	1	3 (Highest)

Table 10-3. IP Register -- IP - Interrupt Priority Register (B8h)

7	6	5	4	3	2	1	0

Reset Value = XXX0 0000b
Not bit addressable

11. Idle mode

An instruction that sets PCON.0 causes that to be the last instruction executed before going into the Idle mode. In the Idle mode, the internal clock signal is gated off to the CPU, but not to the interrupt, Timer, and Serial Port functions. The CPU status is preserved in its entirely : the Stack Pointer, Program Counter, Program Status Word, Accumulator and all other registers maintain their data during Idle. The port pins hold the logical states they had at the time Idle was activated. ALE and PSEN hold at logic high levels.

There are two ways to terminate the Idle. Activation of any enabled interrupt will cause PCON.0 to be cleared by hardware, terminating the Idle mode. The interrupt will be serviced, and following RETI the next instruction to be executed will be the one following the instruction that put the device into idle.

The flag bits GF0 and GF1 can be used to give and indication if an interrupt occured during normal operation or during an Idle. For example, an instruction that activates Idle can also set one or both flag bits. When Idle is terminated by an interrupt, the interrupt service routine can examine the flag bits.

The over way of terminating the Idle mode is with a hardware reset. Since the clock oscillator is still running, the hardware reset needs to be held active for only two machine cycles (24 oscillator periods) to complete the reset.

11.1 Power-Down Mode

To save maximum power, a power-down mode can be invoked by software (Refer to Table 9-4., PCON register).

In power-down mode, the oscillator is stopped and the instruction that invoked power-down mode is the last instruction executed. The internal RAM and SFRs retain their value until the power-down mode is terminated. V_{CC} can be lowered to save further power. Either a hardware reset or an external interrupt can cause an exit from power-down. To properly terminate power-down, the reset or external interrupt should not be executed before V_{CC} is restored to its normal operating level and must be held active long enough for the oscillator to restart and stabilize.

Only external interrupts $\overline{INT0}$ and $\overline{INT1}$ are useful to exit from power-down. For that, interrupt must be enabled and configured as level or edge sensitive interrupt input.
Holding the pin low restarts the oscillator but bringing the pin high completes the exit as detailed in Figure 11-1. When both interrupts are enabled, the oscillator restarts as soon as one of the two inputs is held low and power down exit will be completed when the first input will be released. In this case the higher priority interrupt service routine is executed.
Once the interrupt is serviced, the next instruction to be executed after RETI will be the one following the instruction that put TS80C31X2 into power-down mode.

12. ONCE™ Mode (ON Chip Emulation)

The ONCE mode facilitates testing and debugging of systems using TS80C31X2 without removing the circuit from the board. The ONCE mode is invoked by driving certain pins of the TS80C31X2; the following sequence must be exercised:

- Pull ALE low while the device is in reset (RST high) and $\overline{\text{PSEN}}$ is high.
- Hold ALE low as RST is deactivated.

While the TS80C31X2 is in ONCE mode, an emulator or test CPU can be used to drive the circuit Table 26. shows the status of the port pins during ONCE mode.

Normal operation is restored when normal reset is applied.

Table 12-1. External Pin Status during ONCE Mode

ALE	PSEN	Port 0	Port 1	Port 2	Port 3	XTAL1/2
Weak pull-up	Weak pull-up	Float	Weak pull-up	Weak pull-up	Weak pull-up	Active

13. Power-Off Flag

The power-off flag allows the user to distinguish between a “cold start” reset and a “warm start” reset.

A cold start reset is the one induced by V_{CC} switch-on. A warm start reset occurs while V_{CC} is still applied to the device and could be generated for example by an exit from power-down.

The power-off flag (POF) is located in PCON register (See Table 13-1.). POF is set by hardware when V_{CC} rises from 0 to its nominal voltage. The POF can be set or cleared by software allowing the user to determine the type of reset.

The POF value is only relevant with a Vcc range from 4.5V to 5.5V. For lower Vcc value, reading POF bit will return indeterminate value.

Table 13-1. PCON Register -- PCON - Power Control Register (87h)

7	6	5	4	3	2	1	0
SMOD1	**SMOD0**	**-**	**POF**	**GF1**	**GF0**	**PD**	**IDL**

Bit Number	Bit Mnemonic	Description
7	SMOD1	**Serial port Mode bit 1** Set to select double baud rate in mode 1, 2 or 3.
6	SMOD0	**Serial port Mode bit 0** Clear to select SM0 bit in SCON register. Set to to select FE bit in SCON register.
5	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
4	POF	**Power-Off Flag** Clear to recognize next reset type. Set by hardware when V_{CC} rises from 0 to its nominal voltage. Can also be set by software.
3	GF1	**General purpose Flag** Cleared by user for general purpose usage. Set by user for general purpose usage.
2	GF0	**General purpose Flag** Cleared by user for general purpose usage. Set by user for general purpose usage.
1	PD	**Power-Down mode bit** Cleared by hardware when reset occurs. Set to enter power-down mode.
0	IDL	**Idle mode bit** Clear by hardware when interrupt or reset occurs. Set to enter idle mode.

Reset Value = 00X1 0000b
Not bit addressable

14. Electrical Characteristics

14.1 Absolute Maximum Ratings [1]

Ambiant Temperature Under Bias:
C = commercial0°C to 70°C
I = industrial -40°C to 85°C
Storage Temperature-65°C to + 150°C
Voltage on V_{CC} to V_{SS}-0.5 V to + 7 V
Voltage on V_{PP} to V_{SS}-0.5 V to + 13 V
Voltage on Any Pin to V_{SS}-0.5 V to V_{CC} + 0.5 V
Power Dissipation1 W[2]

Note:
1. Stresses at or above those listed under " Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions may affect device reliability.
2. This value is based on the maximum allowable die temperature and the thermal resistance of the package.

14.2 Power consumption measurement

Since the introduction of the first C51 devices, every manufacturer made operating Icc measurements under reset, which made sense for the designs were the CPU was running under reset. In Atmel Wireless & Microcontrollers new devices, the CPU is no more active during reset, so the power consumption is very low but is not really representative of what will happen in the customer system. That's why, while keeping measurements under Reset, Atmel Wireless & Microcontrollers presents a new way to measure the operating Icc:

Using an internal test ROM, the following code is executed:

Label: SJMP Label (80 FE)

Ports 1, 2, 3 are disconnected, Port 0 is tied to FFh, EA = Vcc, RST = Vss, XTAL2 is not connected and XTAL1 is driven by the clock.

This is much more representative of the real operating Icc.

14.5 AC Parameters

14.5.1 Explanation of the AC Symbols

Each timing symbol has 5 characters. The first character is always a “T” (stands for time). The other characters, depending on their positions, stand for the name of a signal or the logical status of that signal. The following is a list of all the characters and what they stand for.

Example:T_{AVLL} = Time for Address Valid to ALE Low.
T_{LLPL} = Time for ALE Low to $\overline{PSEN}$ Low.

T_A = 0 to +70°C (commercial temperature range); V_{SS} = 0 V; V_{CC} = 5 V ± 10%; -M and -V ranges.
T_A = -40°C to +85°C (industrial temperature range); V_{SS} = 0 V; V_{CC} = 5 V ± 10%; -M and -V ranges.
T_A = 0 to +70°C (commercial temperature range); V_{SS} = 0 V; 2.7 V < V_{CC} < 5.5 V; -L range.
T_A = -40°C to +85°C (industrial temperature range); V_{SS} = 0 V; 2.7 V < V_{CC} < 5.5 V; -L range.

Table 14-3. gives the maximum applicable load capacitance for Port 0, Port 1, 2 and 3, and ALE and $\overline{PSEN}$ signals. Timings will be guaranteed if these capacitances are respected. Higher capacitance values can be used, but timings will then be degraded.

Table 14-3. Load Capacitance versus speed range, in pF

	-M	-V	-L
Port 0	100	50	100
Port 1, 2, 3	80	50	80
ALE / $\overline{PSEN}$	100	30	100

Table 8-5., Table 8-8. and Table 8-11. give the description of each AC symbols.

Table 14-6., Table 14-9. and Table 14-12. give for each range the AC parameter.

Table 14-10. AC Parameters for a Variable Clock: derating formula

Symbol	Type	Standard Clock	X2 Clock	-M	-V	-L	Units
T_{RLRH}	Min	6 T - x	3 T - x	20	15	25	ns
T_{WLWH}	Min	6 T - x	3 T - x	20	15	25	ns
T_{RLDV}	Max	5 T - x	2.5 T - x	25	23	30	ns
T_{RHDX}	Min	x	x	0	0	0	ns
T_{RHDZ}	Max	2 T - x	T - x	20	15	25	ns
T_{LLDV}	Max	8 T - x	4T -x	40	35	45	ns
T_{AVDV}	Max	9 T - x	4.5 T - x	60	50	65	ns
T_{LLWL}	Min	3 T - x	1.5 T - x	25	20	30	ns
T_{LLWL}	Max	3 T + x	1.5 T + x	25	20	30	ns
T_{AVWL}	Min	4 T - x	2 T - x	25	20	30	ns
T_{QVWX}	Min	T - x	0.5 T - x	15	10	20	ns
T_{QVWH}	Min	7 T - x	3.5 T - x	15	10	20	ns
T_{WHQX}	Min	T - x	0.5 T - x	10	8	15	ns
T_{RLAZ}	Max	x	x	0	0	0	ns
T_{WHLH}	Min	T - x	0.5 T - x	15	10	20	ns
T_{WHLH}	Max	T + x	0.5 T + x	15	10	20	ns

14.5.3 External Data Memory Write Cycle

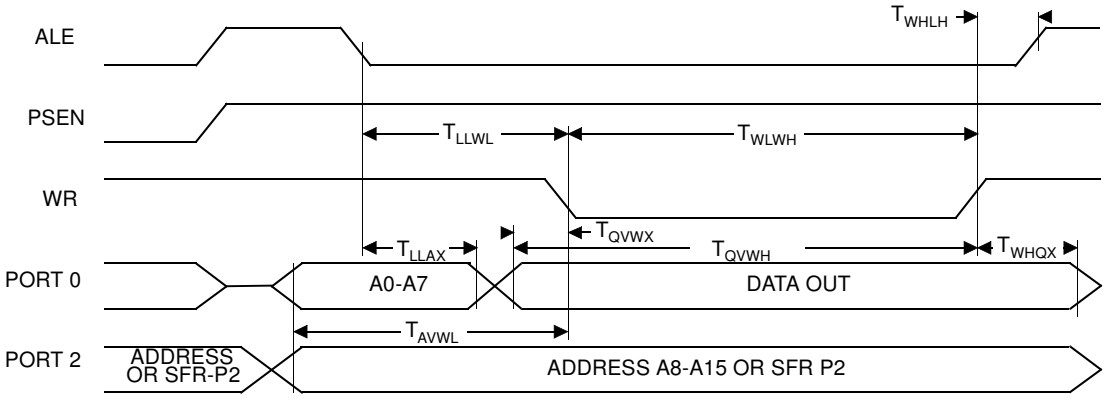

Figure 14-7. External Data Memory Write Cycle

14.5.4 External Data Memory Read Cycle

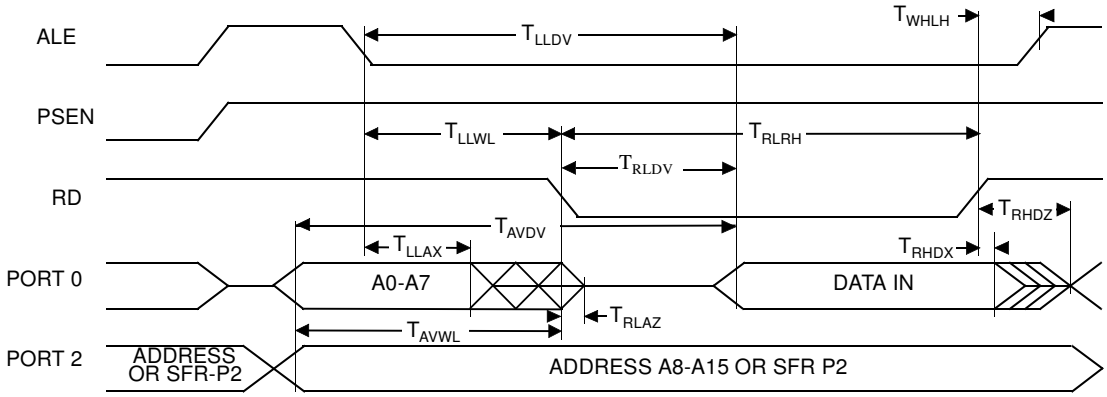

Figure 14-8. External Data Memory Read Cycle

Table 14-11. Serial Port Timing - Shift Register Mode

Symbol	Parameter
T_{XLXL}	Serial port clock cycle time
T_{QVHX}	Output data set-up to clock rising edge
T_{XHQX}	Output data hold after clock rising edge
T_{XHDX}	Input data hold after clock rising edge
T_{XHDV}	Clock rising edge to input data valid

Table 14-12. AC Parameters for a Fix Clock

Speed	-M 40 MHz		-V X2 mode 30 MHz 60 MHz equiv.		-V standard mode 40 MHz		-L X2 mode 20 MHz 40 MHz equiv.		-L standard mode 30 MHz		Units
Symbol	**Min**	**Max**	**Min**	**Max**	**Min**	**Max**	**Min**	**Max**	**Min**	**Max**	
T_{XLXL}	300		200		300		300		400		ns
T_{QVHX}	200		117		200		200		283		ns
T_{XHQX}	30		13		30		30		47		ns
T_{XHDX}	0		0		0		0		0		ns
T_{XHDV}		117		34		117		117		200	ns
