#### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

##### Details

Product Status	Obsolete
Core Processor	CIP-51 8051
Core Size	8-Bit
Speed	72MHz
Connectivity	I <sup>2</sup> C, SMBus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	29
Program Memory Size	16KB (16K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1.25K x 8
Voltage - Supply (Vcc/Vdd)	2.2V ~ 3.6V
Data Converters	A/D 20x14b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	32-UFQFN Exposed Pad
Supplier Device Package	32-QFN (4x4)

## Timers (Timer 0, Timer 1, Timer 2, Timer 3, Timer 4, and Timer 5)

Several counter/timers are included in the device: two are 16-bit counter/timers compatible with those found in the standard 8051, and the rest are 16-bit auto-reload timers for timing peripherals or for general purpose use. These timers can be used to measure time intervals, count external events and generate periodic interrupt requests. Timer 0 and Timer 1 are nearly identical and have four primary modes of operation. The other timers offer both 16-bit and split 8-bit timer functionality with auto-reload and capture capabilities.

Timer 0 and Timer 1 include the following features:

- Standard 8051 timers, supporting backwards-compatibility with firmware and hardware.
- Clock sources include SYSCLK, SYSCLK divided by 12, 4, or 48, the External Clock divided by 8, or an external pin.
- 8-bit auto-reload counter/timer mode
- 13-bit counter/timer mode
- 16-bit counter/timer mode
- Dual 8-bit counter/timer mode (Timer 0)

Timer 2, Timer 3, Timer 4, and Timer 5 are 16-bit timers including the following features:

- Clock sources for all timers include SYSCLK, SYSCLK divided by 12, or the External Clock divided by 8
- LFOSC0 divided by 8 may be used to clock Timer 3 and Timer 4 in active or suspend/snooze power modes
- Timer 4 is a low-power wake source, and can be chained together with Timer 3
- 16-bit auto-reload timer mode
- Dual 8-bit auto-reload timer mode
- External pin capture
- LFOSC0 capture
- Comparator 0 capture
- Configurable Logic output capture

## Watchdog Timer (WDT0)

The device includes a programmable watchdog timer (WDT) running off the low-frequency oscillator. A WDT overflow forces the MCU into the reset state. To prevent the reset, the WDT must be restarted by application software before overflow. If the system experiences a software or hardware malfunction preventing the software from restarting the WDT, the WDT overflows and causes a reset. Following a reset, the WDT is automatically enabled and running with the default maximum time interval. If needed, the WDT can be disabled by system software or locked on to prevent accidental disabling. Once locked, the WDT cannot be disabled until the next system reset. The state of the RST pin is unaffected by this reset.

The Watchdog Timer has the following features:

- Programmable timeout interval
- Runs from the low-frequency oscillator
- Lock-out feature to prevent any modification until a system reset

## 3.6 Communications and Other Digital Peripherals

### Universal Asynchronous Receiver/Transmitter (UART0)

UART0 is an asynchronous, full duplex serial port offering modes 1 and 3 of the standard 8051 UART. Enhanced baud rate support allows a wide range of clock sources to generate standard baud rates. Received data buffering allows UART0 to start reception of a second incoming data byte before software has finished reading the previous data byte.

The UART module provides the following features:

- Asynchronous transmissions and receptions.
- Baud rates up to SYSCLK/2 (transmit) or SYSCLK/8 (receive).
- 8- or 9-bit data.
- Automatic start and stop generation.
- Single-byte FIFO on transmit and receive.

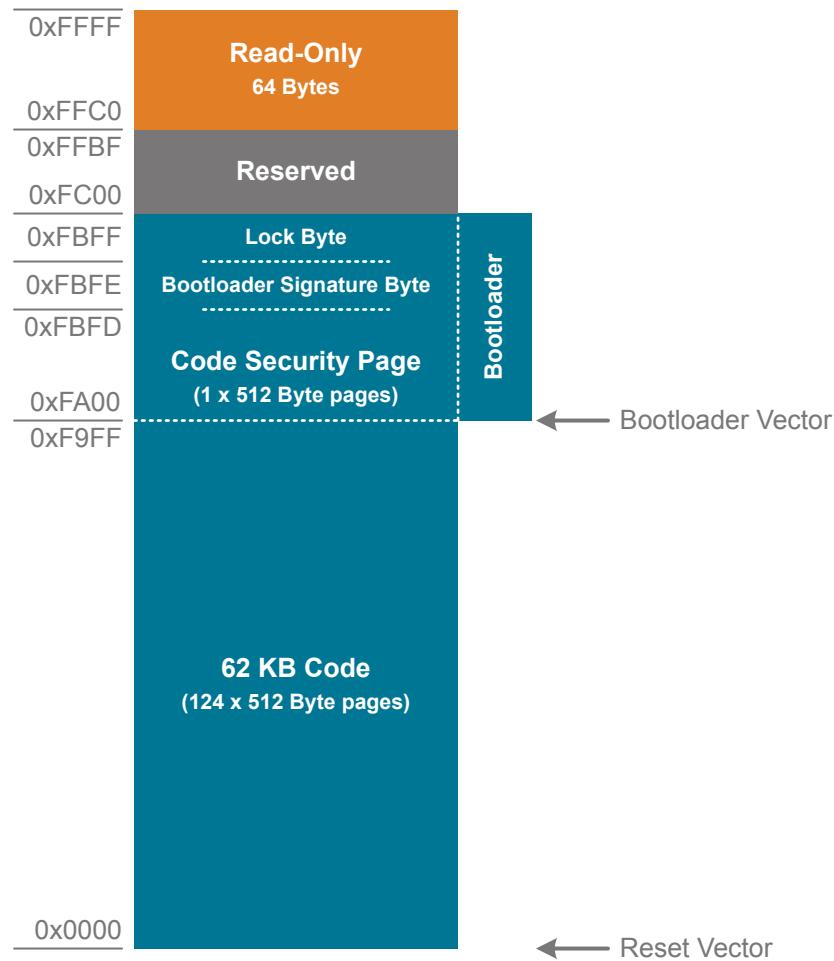

### 3.10 Bootloader

All devices come pre-programmed with a UART0 bootloader or an SMBus bootloader. These bootloaders reside in the code security page, which is the last page of code flash; they can be erased if they are not needed.

The byte before the Lock Byte is the Bootloader Signature Byte. Setting this byte to a value of 0xA5 indicates the presence of the bootloader in the system. Any other value in this location indicates that the bootloader is not present in flash.

When a bootloader is present, the device will jump to the bootloader vector after any reset, allowing the bootloader to run. The bootloader then determines if the device should stay in bootload mode or jump to the reset vector located at 0x0000. When the bootloader is not present, the device will jump to the reset vector of 0x0000 after any reset.

More information about the bootloader protocol and usage can be found in *AN945: EFM8 Factory Bootloader User Guide*. Application notes can be found on the Silicon Labs website ([www.silabs.com/8bit-appnotes](http://www.silabs.com/8bit-appnotes)) or within Simplicity Studio by using the [Application Notes] tile.

## 4. Electrical Specifications

### 4.1 Electrical Characteristics

All electrical parameters in all tables are specified under the conditions listed in [Table 4.1 Recommended Operating Conditions](#) on page [14](#), unless stated otherwise.

#### 4.1.1 Recommended Operating Conditions

**Table 4.1. Recommended Operating Conditions**

Parameter	Symbol	Test Condition	Min	Typ	Max	Unit
Operating Supply Voltage on VDD	V <sub>DD</sub>		2.2	—	3.6	V
Operating Supply Voltage on VIO <sup>2</sup> , <sup>3</sup>	V <sub>IO</sub>		2.2	—	V <sub>DD</sub>	V
System Clock Frequency	f <sub>SYSCLK</sub>		0	—	73.5	MHz
Operating Ambient Temperature	T <sub>A</sub>		-40	—	105	°C

**Note:**

1. All voltages with respect to GND
2. In certain package configurations, the VIO and VDD supplies are bonded to the same pin.
3. GPIO levels are undefined whenever VIO is less than 1 V.

		$T = -40 \text{ }^{\circ}\text{C} \text{ to } 105 \text{ }^{\circ}\text{C}$	—	-0.4 to 0.8	—	$\text{ }^{\circ}\text{C}$
Turn-on Time	$t_{ON}$		—	3.5	—	$\mu\text{s}$
Temp Sensor Error Using Typical Slope and Factory-Calibrated Offset <sup>2, 3</sup>	$E_{TOT}$	$T = 0 \text{ }^{\circ}\text{C} \text{ to } 70 \text{ }^{\circ}\text{C}$	-2.6	—	1.8	$\text{ }^{\circ}\text{C}$
		$T = -20 \text{ }^{\circ}\text{C} \text{ to } 85 \text{ }^{\circ}\text{C}$	-2.9	—	2.7	$\text{ }^{\circ}\text{C}$
		$T = -40 \text{ }^{\circ}\text{C} \text{ to } 105 \text{ }^{\circ}\text{C}$	-3.2	—	4.2	$\text{ }^{\circ}\text{C}$

**Note:**

1. Represents one standard deviation from the mean.
2. The factory-calibrated offset value is stored in the read-only area of flash in locations 0xFFD4 (low byte) and 0xFFD5 (high byte). The 14-bit result represents the output of the ADC when sampling the temp sensor using the 1.65 V internal voltage reference.
3. The temp sensor error includes the offset calibration error, slope error, and linearity error. The values are based upon characterization and are not tested across temperature in production. The values represent three standard deviations above and below the mean. Additional information on achieving high measurement accuracy is available in AN929: Accurate Temperature Sensing with the EFM8 Laser Bee MCU Family.

## 11. Revision History

### 11.1 Revision 1.01

October 21st, 2016

Updated QFN24 center pad stencil description.

### 11.2 Revision 1.0

September 6th, 2016

Updated part numbers to revision B.

Updated many specifications with full characterization data.

Added a note regarding which DACs are available to [Table 2.1 Product Selection Guide on page 2](#).

Added specifications for [4.1.16 SMBus](#).

Added bootloader pinout information to [3.10 Bootloader](#).

Added CRC Calculation Time to [4.1.4 Flash Memory](#).

### 11.3 Revision 0.5

February 10th, 2016

Updated [Figure 5.2 Debug Connection Diagram on page 32](#) to move the pull-up resistor on C2D / RSTb to after the series resistor instead of before.

Added S0 devices and information about the SMBus bootloader in [3.10 Bootloader](#).

Added a reference to *AN945: EFM8 Factory Bootloader User Guide* in [3.10 Bootloader](#).

Added mention of the pre-programmed bootloaders in [1. Feature List](#).

Updated all part numbers to revision B.

Added the C oscillator, which is now available on revision B.

Adjusted C1, C2, X2, Y2, and Y1 maximums for [7.2 QFN32 PCB Land Pattern](#).

Adjusted package markings for QFN32 and QSOP24 packages.

Filled in TBD minimum and maximum values for DAC Differential Nonlinearity in [Table 4.12 DACs on page 24](#).

### 11.4 Revision 0.4

Updated specification tables based on current device characterization status and production test limits.

Added bootloader section.

Added typical connection diagrams.

Corrected CLU connections in pin function tables.

### 11.5 Revision 0.3

Added information on the bootloader to [3.10 Bootloader](#).

Updated some characterization TBD values.

### 11.6 Revision 0.1

Initial release.
