Embedded - Microcontrollers - Application Specific: Tailored Solutions for Precision and Performance

Embedded - Microcontrollers - Application Specific represents a category of microcontrollers designed with unique features and capabilities tailored to specific application needs. Unlike general-purpose microcontrollers, application-specific microcontrollers are optimized for particular tasks, offering enhanced performance, efficiency, and functionality to meet the demands of specialized applications.

CPU and Memory Subsystem

CPU

The Cortex-M0 CPU in the CCG1 is part of the 32-bit MCU subsystem, which is optimized for low-power operation with extensive clock gating. It mostly uses 16-bit instructions and executes a subset of the Thumb-2 instruction set. This enables fully compatible binary upward migration of the code to higher performance processors such as the Cortex-M3 and M4, thus enabling upward compatibility. The Cypress implementation includes a hardware multiplier that provides a 32-bit result in one cycle. It includes a nested vectored interrupt controller (NVIC) block with 32 interrupt inputs and a Wakeup Interrupt Controller (WIC). The WIC can wake the processor up from the Deep Sleep mode, allowing power to be switched off to the main processor when the chip is in the Deep Sleep mode. The Cortex-M0 CPU provides a Non-Maskable Interrupt (NMI) input, which is made available to the user when it is not in use for system functions requested by the user.

The CPU also includes a debug interface, the serial wire debug (SWD) interface, which is a 2-wire form of JTAG; the debug configuration used for CCG1 has four break-point (address) comparators and two watchpoint (data) comparators.

Flash

The CCG1 device has a flash module with a flash accelerator, tightly coupled to the CPU to improve average access times from the flash block. The flash block is designed to deliver 1 wait-state (WS) access time at 48 MHz and 0-WS access time at 24 MHz. The flash accelerator delivers 85% of single-cycle SRAM access performance on average. Part of the flash module can be used to emulate EEPROM operation if required.

SRAM

A supervisory ROM that contains boot and configuration routines is provided.

System Resources

Power System

The power system is described in detail in the section [Power on page 11](#). It provides assurance that voltage levels are as required for each respective mode and either delay mode entry (on power-on reset (POR), for example) until voltage levels are as required for proper function or generate resets (Brown-Out Detect (BOD)) or interrupts (Low Voltage Detect (LVD)). The CCG1 operates with a single external supply over the range of 3.2 V to 5.5 V operation and has three different power modes: Active, Sleep, and Deep Sleep; transitions between modes are managed by the power system.

Serial Communication Blocks (SCB)

The CCG1 has one SCB, which can implement an I²C interface. The hardware I²C block implements a full multi-master and slave interface (it is capable of multimaster arbitration). This block is capable of operating at speeds of up to 1 Mbps (Fast Mode Plus) and has flexible buffering options to reduce interrupt overhead and latency for the CPU. It also supports EZ-I²C that creates a mailbox address range in the memory of the CCG1 and effectively reduces I²C communication to reading from and writing to an array in memory. In addition, the block supports an 8-deep

FIFO for receive and transmit which, by increasing the time given for the CPU to read data, greatly reduces the need for clock stretching caused by the CPU not having read data on time.

The I²C peripheral is compatible with the I²C Standard-mode, Fast-mode, and Fast-mode Plus devices, as defined in the NXP I²C-bus specification and user manual (UM10204). The I²C bus I/O is implemented with GPIO in open-drain modes.

The CCG1 is not completely compliant with the I²C spec in the following respects:

- GPIO cells are not overvoltage tolerant and, therefore, cannot be hot-swapped or powered up independently of the rest of the I²C system.
- Fast-mode Plus has an I_{OL} specification of 20 mA at a V_{OL} of 0.4 V. The GPIO cells can sink a maximum of 8 mA I_{OL} with a V_{OL} maximum of 0.6 V.
- Fast-mode and Fast-mode Plus specify minimum Fall times, which are not met with the GPIO cell; Slow strong mode can help meet this spec depending on the Bus Load.
- When the SCB is an I²C Master, it interposes an IDLE state between NACK and Repeated Start; the I²C spec defines Bus free as following a Stop condition so other Active Masters do not intervene but a Master that has just become activated may start an Arbitration cycle.
- When the SCB is in the I²C Slave mode, and Address Match on External Clock is enabled (EC_AM = 1) along with operation in the internally clocked mode (EC_OP = 0), then its I²C address must be even.

GPIO

The CCG1 has up to 30 GPIOs, which are configured for various functions. Refer to the pinout tables for the definitions. The GPIO block implements the following:

- Eight drive strength modes:
 - Analog input mode (input and output buffers disabled)
 - Input only
 - Weak pull-up with strong pull-down
 - Strong pull-up with weak pull-down
 - Open drain with strong pull-down
 - Open drain with strong pull-up
 - Strong pull-up with strong pull-down
 - Weak pull-up with weak pull-down
- Input threshold select (CMOS or LVTTL).
- Individual control of input and output buffer enabling/disabling in addition to the drive strength modes.
- Hold mode for latching previous state (used for retaining I/O state in Deep Sleep mode).
- Selectable slew rates for dV/dt related noise control to improve EMI.

During power-on and reset, the I/O pins are forced to the disable state so as not to crowbar any inputs and/or cause excess turn-on current. A multiplexing network, known as a high-speed I/O matrix, is used to multiplex between various signals that may connect to an I/O pin.

Power

The following power system diagram shows the minimum set of power supply pins as implemented for the CCG1. The system has one regulator in Active mode for the digital circuitry. There is no analog regulator; the analog circuits run directly from the VDDA input. There is a separate regulator for the Deep Sleep mode. There is a separate low-noise regulator for the bandgap. The supply voltage range is 3.2 V to 5.5 V with all functions and circuits operating over that range.

VDDA and VDDD must be shorted together; the grounds, VSSA and VSS must also be shorted together. Bypass capacitors must be used from VDDD to ground. The typical practice for systems in this frequency range is to use a capacitor in the 1-μF range in parallel with a smaller capacitor (0.1 μF, for example). Note that these are simply rules of thumb and that, for critical applications, the PCB layout, lead inductance, and the bypass capacitor parasitic should be simulated to design and obtain optimal bypassing.

Refer to Application Diagrams for bypassing schemes.

Notes

13. It can take as much as 20 milliseconds to write to flash. During this time the device should not be Reset, or flash operations will be interrupted and cannot be relied on to have completed. Reset sources include the XRES pin, software resets, CPU lockup states and privilege violations, improper power supply levels, and watchdogs. Make certain that these are not inadvertently activated.
14. Cypress provides a retention calculator to calculate the retention lifetime based on customers' individual temperature profiles for operation over the –40 °C to +105 °C ambient temperature range. Contact customer care@cypress.com.

T _J (40-QFN, 35-CSP)	Operating junction temperature	–	–40	–	100.00	°C
T _A (16-SOIC)	Operating ambient temperature	–	–40	25.00	105.00	°C
T _J (16-SOIC)	Operating junction temperature	–	–40	–	120.00	°C
T _{JA}	Package θ _{JA} (40-pin QFN)	–	–	15.34	–	°C/Watt
T _{JA}	Package θ _{JA} (35-CSP)	–	–	28.00	–	°C/Watt
T _{JA}	Package θ _{JA} (16-SOIC)	–	–	85.00	–	°C/Watt
T _{JC}	Package θ _{JC} (40-pin QFN)	–	–	02.50	–	°C/Watt
T _{JC}	Package θ _{JC} (35-CSP)	–	–	00.40	–	°C/Watt
T _{JC}	Package θ _{JC} (16-SOIC)	–	–	49.00	–	°C/Watt

Table 25. Solder Reflow Peak Temperature

Package	Maximum Peak Temperature	Maximum Time at Peak Temperature
16-pin SOIC	260 °C	30 seconds
40-pin QFN	260 °C	30 seconds
35-ball WLCSP	260 °C	30 seconds

Table 26. Package Moisture Sensitivity Level (MSL), IPC/JEDEC J-STD-2

Package	MSL
16-pin SOIC	MSL 3
40-pin QFN	MSL 3
35-ball WLCSP	MSL 1

NOTE:

1. DIMENSIONS IN INCHES[MM] MAX.
2. REFERENCE JEDEC MS-012
3. PACKAGE WEIGHT : refer to PMDD spec. 001-04308

PART #	
S16.15	STANDARD PKG.
SZ16.15	LEAD FREE PKG.

Revision History

Description Title: CCG1 Datasheet USB Type-C Port Controller with Power Delivery Document Number: 001-93639				
Revision	ECN	Orig. of Change	Submission Date	Description of Change
**	4520316	MSMI	09/30/2014	New datasheet
*A	4531795	SJH	10/13/2014	Updated Functional Definition . Updated Figure 8, Figure , Figure 7 , Figure , Figure 14, Figure 9 . Added Figure 11 . Updated Pinouts . Updated Power . Updated Figure , Figure 8. Updated Ordering Information Added Note 24 and referred the same note in 40-pin QFN corresponding to CYPD1122-40LQXI. Added Note 27 and referred the same note in 40-pin QFN corresponding to CYPD1134-40LQXI.
*B	4569912	SJH	11/21/2014	Updated Features . Added 16-pin SOIC related information. Updated Functional Definition . Updated Pin Definitions . Added Table 2. Updated Pinouts . Updated Figure 2 , Figure 5 . Added Figure 4 . Updated Power . Updated Figure , Figure 8. Added Figure 6. Updated Electrical Specifications . Updated Device-Level Specifications . Updated Memory . Added Note 14 and referred the same note in F _{RET} parameter. Added details corresponding to spec ID SID182B under F _{RET} parameter. Updated Figure 14, Figure 9 , Figure 11 . Added Figure 8 and Figure 10 . Updated Ordering Information . Updated part numbers. Added a column "Si ID". Updated Packaging . Updated Table 24 . Updated details in maximum value column corresponding to T _A and T _J parameters. Added 16-pin SOIC related information. Updated Table 25 .
*C	4596141	SJH	12/14/2014	Updated Figure 6, Figure 14, Figure 16. Updated Table 8 , Table 23 .
*D	4646123	SJH	02/04/2015	Updated pin definitions for 40-pin QFN and 35-ball WLCSP. Updated Pinout for CYPD1122-40LQXI/CYPD1121-40LQXI and Ordering Information . Updated conditions for Device-Level Specifications . Updated diagrams in Applications in Detail section.
*E	4686050	VGT	03/13/2015	Removed information about 28-pin SSOP. Updated Table 3 , Table 23 , Table 24 , Table 25 , Table 26 , Table 27 . Updated Figure 2 , Figure .
*F	4747272	VGT	05/13/2015	Updated General Description . Added Note 1 and referenced it in Features . Updated Figure 6 , Figure 8 through Figure 11 . Removed Figure 9. Single Chip/Cable, Component Count = 13. Removed Figure 11. Two Chip/Cable, Component Count = 11/paddle.

Revision History *(continued)*

Description Title: CCG1 Datasheet USB Type-C Port Controller with Power Delivery Document Number: 001-93639				
Revision	ECN	Orig. of Change	Submission Date	Description of Change
*G	4800534	VGT	07/02/2015	Updated Low-Power Operation . Updated the number of GPIOs to “up to 30” in GPIO . Updated “1.8 to 5.5 V” to “3.2 V to 5.5 V” in Low-Power Operation , Power System , Power , Device-Level Specifications and Note 15 . Updated Table 2 , Table 4 , Table 5 , Table 6 , Table 7 , Table 8 , Table 14 and Table 18 . Added table footnotes 8 , 9 and 10 . Deleted footnotes 25 through 28. Updated Figure 2 and Figure 8 through Figure 11 . Added Figure 3 . Updated the following in Power : Removed Figures 5 through 8. Updated the section.
*H	4939764	VGT	09/29/2015	Removed specs SID241 and 242. Updated 40-pin QFN package to current revision.
*I	5179365	KISB	03/17/2016	Updated max value of I_{I2C1} from 10.50 μ A to 50 μ A. Updated copyright information and sales links at the end of the document.
*J	5459633	VGT	10/03/2016	Added compliance information regarding the USB Specification. Updated copyright notice to include WICED. Added IoT link in Sales , Solutions , and Legal Information .
