Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Synchronous-DRAM Interface

The RC32332 integrates a SDRAM controller which provides direct control of system SyncDRAM running at speeds to 75MHz.

Key capabilities of the SDRAM controller include:

- Direct control of 4 banks of SDRAM (up to 2 64-bit wide DIMMs)
- On-chip page comparators optimize access latency.
- Speeds to 75MHz
- Programmable address map.
- Supports 16, 64, 128, 256, or 512Mb SDRAM devices
- Automatic refresh generation driven by on-chip timer
- Support for discrete devices, SODIMM, or DIMM modules.

Thus, systems can take advantage of the full range of commodity memory that is available, enabling system optimization for cost, real-estate, or other attributes.

Local Memory and I/O Controller

The local memory and I/O controller implements direct control of external memory devices, including the boot ROM as well as other memory areas, and also implements direct control of external peripherals.

The local memory controller is highly flexible, allowing a wide range of devices to be directly controlled by the RC32332 processor. For example, a system can be built using an 8-bit boot ROM, 16-bit FLASH cards (possibly on PCMCIA), a 32-bit SRAM or dual-port memory, and a variety of low-cost peripherals.

Key capabilities include:

- Direct control of EPROM, FLASH, RAM, and dual-port memories
- 6 chip-select outputs, supporting up to 8MB per memory space
- Supports mixture of 8-, 16-, and 32-bit wide memory regions
- Flexible timing protocols allow direct control of a wide variety of devices
- Programmable address map for 2 chip selects
- Automatic wait state generation.

PCI Bus Bridge

In order to leverage the wide availability of low-cost peripherals for the PC market as well as to simplify the design of add-in functions, the RC32332 integrates a full 32-bit PCI bus bridge. Key attributes of this bridge include:

- 50 MHz operation
- PCI revision 2.2 compliant
- Programmable address mappings between CPU/Local memory and PCI memory and I/O
- On-chip PCI arbiter
- Extensive buffering allows PCI to operate concurrently with local memory transfers
- Selectable byte-ordering swapper.

On-Chip DMA Controller

To minimize CPU exception handling and maximize the efficiency of system bandwidth, the RC32332 integrates a very sophisticated 4-channel DMA controller on chip.

The RC32332 DMA controller is capable of:

- Chaining and scatter/gather support through the use of a flexible, linked list of DMA transaction descriptors
- Capable of memory<->memory, memory<->I/O, and PCI<->memory DMA
- Unaligned transfer support
- Byte, halfword, word, quadword DMA support.

On-Chip Peripherals

The RC32332 also integrates peripherals that are common to a wide variety of embedded systems.

- Single 16550 compatible UART.
- SPI master mode interface for direct interface to EEPROM, A/D, etc.
- Interrupt Controller to speed interrupt decode and management
- Four 32-bit on-chip Timer/Counters
- Programmable I/O module

Debug Support

To facilitate rapid time to market, the RC32332 provides extensive support for system debug.

First and foremost, this product integrates an EJTAG in-circuit emulation module, allowing a low-cost emulator to interoperate with programs executing on the controller. By using an augmented JTAG interface, the RC32332 is able to reuse the same low-cost emulators developed around the RC32364 CPU.

cpu_masterclk	Input		—	**CPU Master System Clock** Provides the basic system clock.
cpu_int_n[1:0]	Input		—	**CPU Interrupt** Requires an external pull-up. These interrupt inputs are active low to the CPU.
cpu_coldreset_n	Input	L	—	**CPU Cold Reset** This active-low signal is asserted to the RC32332 after V_{cc} becomes valid on the initial power-up. The Reset initialization vectors for the RC32332 are latched by cold reset.

JTAG Interface Signals				
jtag_tck	Input		—	**JTAG Test Clock** Requires an external pull-down. An input test clock used to shift into or out of the Boundary-Scan register cells. jtag_tck is independent of the system and the processor clock with nominal 50% duty cycle.
jtag_tdi, ejtag_dint_n	Input		—	**JTAG Test Data In** Requires an external pull-up. On the rising edge of jtag_tck, serial input data are shifted into either the Instruction or Data register, depending on the TAP controller state. During Real Mode, this input is used as an interrupt line to stop the debug unit from Real Time mode and return the debug unit back to Run Time Mode (standard JTAG). This pin is also used as the ejtag_dint_n signal in the EJTAG mode.
jtag_tdo, ejtag_tpc	Output	Z	High	**JTAG Test Data Out** The jtag_tdo is serial data shifted out from instruction or data register on the falling edge of jtag_tck. When no data is shifted out, the jtag_tdo is tri-stated. During Real Time Mode, this signal provides a non-sequential program counter at the processor clock or at a division of processor clock. This pin is also used as the ejtag_tpc signal in the EJTAG mode.
jtag_tms	Input		—	**JTAG Test Mode Select** Requires an external pull-up. The logic signal received at the jtag_tms input is decoded by the TAP controller to control test operation. jtag_tms is sampled on the rising edge of the jtag_tck.
jtag_trst_n	Input	L	—	**JTAG Test Reset** When neither JTAG nor EJTAG are being used, jtag_trst_n must be driven low (pulled down) or the jtag_tms/ejtag_tms signals must be pulled up and jtag_clk actively clocked.
ejtag_dclk	Output	Z	—	**EJTAG Test Clock** Processor Clock. During Real Time Mode, this signal is used to capture address and data from the ejtag_tpc signal at the processor clock speed or any division of the internal pipeline.

ejtag_debugboot	Input		—	**EJTAG DebugBoot** Requires an external pull-down. The ejtag_debugboot input is used during reset and forces the CPU core to take a debug exception at the end of the reset sequence instead of a reset exception. This enables the CPU to boot from the ICE probe without having the external memory working. This input signal is level sensitive and is not latched internally. This signal will also set the JtagBrk bit in the JTAG_Control_Register[12].
ejtag_tms	Input		—	**EJTAG Test Mode Select** Requires an external pull-up. The ejtag_tms is sampled on the rising edge of jtag_tck.

Table 6 AC Timing Characteristics - RC32332 (Part 4 of 4)

1. At all pipeline frequencies.

2. Guaranteed by design.

3. This PCI interface conforms to the PCI Local Bus Specification, Rev 2.2 at 33MHz.

4. pci_rst_n is tested per PCI 2.2 as an asynchronous signal.

Standard EJTAG Timing — RC32332

Figure 4 represents the timing diagram for the EJTAG interface signals.

The standard JTAG connector is a 10-pin connector providing 5 signals and 5 ground pins. For Standard EJTAG, a 24-pin connector has been chosen providing 12 signals and 12 ground pins. This guarantees elimination of noise problems by incorporating signal-ground type arrangement. Refer to the RC32334/RC32332 User Reference Manual for connector pinout and mechanical specifications.

Power Ramp-up

3.3V Device

There is no special requirement for how fast V_{cc} I/O ramps up to 3.3V. However, all timing references are based on a stable V_{cc} I/O.

2.5V Device

The 2.5V core supply (and 2.5V V_{cc}P supply) can be fully powered without the 3.3V I/O supply. However, the 3.3V I/O supply cannot exceed the 2.5V core supply by more than 1 volt during power up. A sustained large power difference could potentially damage the part. Inputs should not be driven until the part is fully powered. Specifically, the input high voltages should not be applied until the 3.3V I/O supply is powered.

There is no special requirement for how fast V_{cc} I/O ramps up to 3.3V. However, all timing references are based on a stable V_{cc} I/O.

1. Functional and tested operating conditions are given in Table 7. Absolute maximum ratings are stress ratings only, and functional operation is not guaranteed beyond recommended operating voltages and temperatures. Stresses beyond those listed may affect device reliability or cause permanent damage to the device.

2. All PCI pads are fully compatible with PCI Specification version 2.2.
