What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

System				
RESET_N	ı	Reset input pin. When this pin is set to a "L" level, system reset mode is	_	Negative
_		set and the internal section is initialized. When this pin is set to a "H" level		J
		subsequently, program execution starts. A pull-up resistor is internally		
		connected.		
XT0	I	Crystal connection pin for low-speed clock.	_	_
		A 32.768 kHz crystal oscillator (see measuring circuit 1) is connected to		
XT1	0	this pin. Capacitors CDL and CGL are connected across this pin and $V_{\mbox{\footnotesize SS}}$	_	_
		as required.		
OSC0	- 1	Crystal/ceramic connection pin for high-speed clock.	Secondary	_
		A crystal or ceramic is connected to this pin (4.1 MHz max.). Capacitors		
		CDH and CGH (see measuring circuit 1) are connected across this pin		
OSC1	0	and V <sub>SS</sub> .	Secondary	_
		This pin is used as the secondary function of the P10 pin(OSC0) and P11		
		pin(OSC1).		
LSCLK	0	Low-speed clock output pin. This pin is used as the secondary function of	Secondary	
		the P20 pin.		
OUTCLK	0	High-speed clock output pin. This pin is used as the secondary function of	Secondary	_
		the P21 pin.		
General-purp	ose in	put port		
P00-P03	- 1	General-purpose input port.	Primary	Positive
		Since these pins have secondary functions, the pins cannot be used as a		
		port when the secondary functions are used.		
P10-P11	- 1	General-purpose input port.	Primary	Positive
		Since these pins have secondary functions, the pins cannot be used as a

#### Note:

- Please have the shortest layout for the common node (wiring patterns which are connected to the external capacitors, resistors and IN0/IN1 pin), including CVR0/CVR1. Especially, do not have long wire between IN0/IN1 and RS0/RS1. The coupling capacitance on the wires may occur incorrect A/D conversion. Also, please do not have signals which may be a source of noise around the node.
- When RT0/RT1 (Thermistor and etc.) requires long wiring due to the restricted placement, please have VSS(GND) trace next to the signal.
- Please make wiring to components (capacitor, resisteor and etc.) necessory for objective measurement. Wiring to reserved components may affect to the A/D conversion operation by noise the components itself may have.
