### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

#### Details

Product Status	Active
Core Processor	Z8
Core Size	8-Bit
Speed	20MHz
Connectivity	UART/USART
Peripherals	DMA
Number of I/O	32
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	128K x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	44-LCC (J-Lead)
Supplier Device Package	-

CUSTOMER PROCUREMENT SPECIFICATION

**Z88C00/01**  
**CMOS SUPER8®**  
**ROMLESS MCU**

**GENERAL DESCRIPTION**

The CMOS Super8® offers new flexibility and sophistication in 8-bit microcontrollers. The Super8 offers all the features necessary for industrial, consumer, and automotive applications with an enhanced feature set in CMOS technology. At the same time, the CMOS Super8 retains full pin-for-pin compatibility with the NMOS Super8. Available in 48-pin DIP, and 44-, 68-pin PLCC, the CMOS Super8 is the last word in general purpose controllers.

The Super8 features a full-duplex, Universal Asynchronous Receiver/Transmitter (UART) with on-chip baud rate generator, on-chip oscillator, and a Direct Memory Access controller (DMA).

**Notes:**

All Signals with a preceding front slash, "/", are active Low, e.g.: B/W (WORD is active Low); /B/W (BYTE is active Low, only).

Power connections follow conventional descriptions below:

Connection	Circuit	Device
Power	$V_{CC}$	$V_{DD}$
Ground	GND	$V_{SS}$

## ABSOLUTE MAXIMUM RATINGS

Symbol	Description	Min	Max	Units
$V_{CC}$	Supply Voltage (*)	-0.3	+7.0	V
$T_{STG}$	Storage Temp	-65°	+150°	C
$T_A$	Oper Ambient Temp		†	C

### Notes:

\* Voltage on all pins with respect to GND.

† See Ordering Information.

Stress greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; operation of the device at any condition above those indicated in the operational sections of these specifications is not implied. Exposure to absolute maximum rating conditions for an extended period may affect device reliability.

## STANDARD TEST CONDITIONS

The characteristics listed below apply for standard test conditions as noted. All voltages are referenced to  $V_{SS}$ . Positive current flows into the referenced pin (Standard Test Load).

Standard conditions are:

- $4.5V < V_{CC} < 5.5V$
- GND - 0V
- $-40^{\circ}C < T_A < +105^{\circ}C$

Standard Test Load

## ADDITIONAL FEATURE

### Weak Latches

All input pins on the Super8\* will be provided with weak latches. Weak latches on inputs prevent them from floating and reduces unnecessary current flow. Weak latches on inputs are automatically disabled when the corresponding output is configured as open-drain.

### Notes:

[1] Not characterized function, guaranteed by design.

The value of TsDI (DSR) has been measured for the NMOS part as mentioned below as TsDI (DSR) old. This "old" value needs to be relaxed as to the value described as

TsDI (DSR) new. This new value will allow the customer to use external memories with slower access times that immediately translates in lower cost.

## 20 MHZ NORMAL TIMING

External Memory Read And Write

## Z88C00 ERRATA

1. Handshake Port 4  
Input handshake (strobe and fully interlocked mode) with DMA is not functional.
2. UART Receive  
Upon receiving a character, the RCA (receive character available) interrupt is serviced twice. The time between two consecutive interrupts at 14 MHz is 53  $\mu$ s. Although the UIO is read, which normally should clear the interrupt source, the RCA interrupt is asserted twice.
3. TTL Levels  
 $V_{IH}$ ,  $V_{IL}$  do not meet the TTL specification when the port is used as control inputs for the counter/timers, UART, handshake, external wait and interrupts. Instead  $V_{IH} = 0.7 V_{CC}$  and  $V_{IL} = 0.15 V_{CC}$ .
4. DMA Usage  
No DMA can be performed to external memories if the wait feature (hardware wait and software wait) is used.
5. Reset Software Sequence  
After a hardware reset, program the POM register before the PM register.
6. Counter/Timers  
To obtain a 2.5 MHz signal from the counter/timers, load the Counter/Timer registers with FFFFH and count up. The equivalent operations for the NMOS part to obtain the 2.5 MHz signal is to load the counter/timers with 0000H and count down.
