
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	eZ8
Core Size	8-Bit
Speed	5MHz
Connectivity	IrDA, UART/USART
Peripherals	Brown-out Detect/Reset, LED, POR, PWM, WDT
Number of I/O	16
Program Memory Size	2KB (2K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	512 x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SOIC (0.295", 7.50mm Width)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8f0213sh005sg

Pin Description

Z8 Encore! XP F0823 Series products are available in a variety of package styles and pin configurations. This chapter describes the signals and pin configurations available for each of the package styles. For information about physical package specifications, see the Packaging chapter on page 210.

Available Packages

Table 2 lists the package styles that are available for each device in the F0823 Series product line.

Table 2. F0823 Series Package Options

Part Number	ADC	8-pin PDIP	8-pin SOIC	20-pin PDIP	20-pin SOIC	20-pin SSOP	28-pin PDIP	28-pin SOIC	28-pin SSOP	8-pin QFN/ MLF-S
Z8F0823	Yes	X	X	X	X	X	X	X	X	X
Z8F0813	No	X	X	X	X	X	X	X	X	X
Z8F0423	Yes	X	X	X	X	X	X	X	X	X
Z8F0413	No	X	X	X	X	X	X	X	X	X
Z8F0223	Yes	X	X	X	X	X	X	X	X	X
Z8F0213	No	X	X	X	X	X	X	X	X	X
Z8F0123	Yes	X	X	X	X	X	X	X	X	X
Z8F0113	No	X	X	X	X	X	X	X	X	X

Pin Configurations

Figures 2 through 4 display the pin configurations for all packages available in the F0823 Series. For description of signals, see Table 3. The analog input alternate functions (ANA*x*) are not available on the Z8F0x13 devices. The analog supply pins (AV_{DD} and AV_{SS}) are also not available on these parts, and are replaced by PB6 and PB7.

At reset, all pins of Ports A, B, and C default to an input state. In addition, any alternate functionality is not enabled, so the pins function as general-purpose input ports until programmed otherwise.

The pin configurations listed are preliminary and subject to change based on manufacturing limitations.

Table 8. Register File Address Map (Continued)

Address (Hex)	Register Description	Mnemonic	Reset (Hex)	Page No.
GPIO Port B (cont'd)				
FD6	Port B Input Data	PBIN	XX	43
FD7	Port B Output Data	PBOUT	00	43
GPIO Port C				
FD8	Port C Address	PCADDR	00	40
FD9	Port C Control	PCCTL	00	42
FDA	Port C Input Data	PCIN	XX	43
FDB	Port C Output Data	PCOUT	00	43
FDC–FEF	Reserved	—	XX	
Watchdog Timer (WDT)				
FF0	Reset Status	RSTSTAT	XX	94
	Watchdog Timer Control	WDTCTL	XX	94
FF1	Watchdog Timer Reload Upper Byte	WDTU	FF	95
FF2	Watchdog Timer Reload High Byte	WDTH	FF	95
FF3	Watchdog Timer Reload Low Byte	WDTL	FF	95
FF4–FF5	Reserved	—	XX	
Trim Bit Control				
FF6	Trim Bit Address	TRMADR	00	148
FF7	Trim Data	TRMDR	XX	149
Flash Memory Controller				
FF8	Flash Control	FCTL	00	141
FF8	Flash Status	FSTAT	00	142
FF9	Flash Page Select	FPS	00	143
	Flash Sector Protect	FPROT	00	144
FFA	Flash Programming Frequency High Byte	FFREQH	00	145
FFB	Flash Programming Frequency Low Byte	FFREQL	00	145

Note: XX=Undefined.

Table 17. Port Alternate Function Mapping (Non 8-Pin Parts)

Port	Pin	Mnemonic	Alternate Function Description	Alternate Function Set Register AFS1
Port A[1]	PA0	T0IN/$\overline{\text{T0OUT}}$	Timer 0 Input/Timer 0 Output Complement	N/A
		Reserved		
	PA1	T0OUT	Timer 0 Output	
		Reserved		
	PA2	$\overline{\text{DE0}}$	$\overline{\text{UART 0 Driver Enable}}$	
		Reserved		
	PA3	$\overline{\text{CTS0}}$	$\overline{\text{UART 0 Clear to Send}}$	
		Reserved		
	PA4	RXD0/IRRX0	UART 0 / IrDA 0 Receive Data	
		Reserved		
	PA5	TXD0/IRTX0	UART 0 / IrDA 0 Transmit Data	
		Reserved		
	PA6	T1IN/$\overline{\text{T1OUT}}$[2]	Timer 1 Input/Timer 1 Output Complement	
		Reserved		
	PA7	T1OUT	Timer 1 Output	
		Reserved		

Notes:
1. Because there is only a single alternate function for each Port A pin, the Alternate Function Set registers are not implemented for Port A. Enabling alternate function selections as described in the Port A–C Alternate Function Subregisters section on page 43 automatically enables the associated alternate function.
2. Whether PA0/PA6 take on the timer input or timer output complement function depends on the timer configuration as described in the Timer Pin Signal Operation section on page 83.
3. Because there are at most two choices of alternate function for any pin of Port B, the Alternate Function Set register AFS2 is implemented but not used to select the function. Also, alternate function selection as described in the Port A–C Alternate Function Subregisters section on page 43 must also be enabled.
4. V_{REF} is available on PB5 in 28-pin products only.
5. Because there are at most two choices of alternate function for any pin of Port C, the Alternate Function Set register AFS2 is implemented but not used to select the function. Also, Alternate Function selection as described in the Port A–C Alternate Function Subregisters section on page 43 must also be enabled.
6. V_{REF} is available on PC2 in 20-pin parts only.

Table 18. GPIO Port Registers and Subregisters (Continued)

Port Register Mnemonic	Port Register Name
P*x*HDE	High Drive Enable.
P*x*SMRE	Stop Mode Recovery Source Enable.
P*x*PUE	Pull-up Enable.
PxAFS1	Alternate Function Set 1.
PxAFS2	Alternate Function Set 2.

Port A–C Address Registers

The Port A–C Address registers select the GPIO port functionality accessible through the Port A–C Control registers. The Port A–C Address and Control registers combine to provide access to all GPIO port controls (Table 19).

Table 19. Port A–C GPIO Address Registers (P*x*ADDR)

Bit	7	6	5	4	3	2	1	0
Field	PADDR[7:0]							
RESET	00H							
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	FD0H, FD4H, FD8H							

Bit	Description
[7:0] PADDR	**Port Address** The Port Address selects one of the subregisters accessible through the Port Control Register. See Table 20 for each subregister function.

Table 20. PADDR[7:0] Subregister Functions

PADDR[7:0]	Port Control Subregister Accessible Using the Port A–C Control Registers
00H	No function. Provides some protection against accidental Port reconfiguration.
01H	Data Direction.
02H	Alternate Function.
03H	Output Control (Open-Drain).
04H	High Drive Enable.

Port A–C High Drive Enable Subregisters

The Port A–C High Drive Enable Subregister (Table 25) is accessed through the Port A–C Control Register by writing 04H to the Port A–C Address Register. Setting the bits in the Port A–C High Drive Enable subregisters to 1 configures the specified port pins for high-current output drive operation. The Port A–C High Drive Enable Subregister affects the pins directly and, as a result, alternate functions are also affected.

Table 25. Port A–C High Drive Enable Subregisters (PHDEx)

Bit	7	6	5	4	3	2	1	0
Field	PHDE7	PHDE6	PHDE5	PHDE4	PHDE3	PHDE2	PHDE1	PHDE0
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	If 04H in Port A–C Address Register, accessible through the Port A–C Control Register							

Bit	Description
[7:0] PHDEx	**Port High Drive Enabled.** 0 = The Port pin is configured for standard output current drive. 1 = The Port pin is configured for high output current drive.

Note: x indicates the specific GPIO port pin number (7–0).

Port A–C Stop Mode Recovery Source Enable Subregisters

The Port A–C Stop Mode Recovery Source Enable Subregister (Table 26) is accessed through the Port A–C Control Register by writing 05H to the Port A–C Address Register. Setting the bits in the Port A–C Stop Mode Recovery Source Enable subregisters to 1 configures the specified Port pins as a Stop Mode Recovery source. During STOP Mode, any logic transition on a Port pin enabled as a Stop Mode Recovery source initiates Stop Mode Recovery.

Table 26. Port A–C Stop Mode Recovery Source Enable Subregisters (PSMREx)

Bit	7	6	5	4	3	2	1	0
Field	PSMRE7	PSMRE6	PSMRE5	PSMRE4	PSMRE3	PSMRE2	PSMRE1	PSMRE0
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	If 05H in Port A–C Address Register, accessible through the Port A–C Control Register							

Bit	Description
[7:0] PSMREx	**Port Stop Mode Recovery Source Enabled.** 0 = The Port pin is not configured as a Stop Mode Recovery source. Transitions on this pin during STOP Mode do not initiate Stop Mode Recovery. 1 = The Port pin is configured as a Stop Mode Recovery source. Any logic transition on this pin during STOP Mode initiates Stop Mode Recovery.

Note: x indicates the specific GPIO port pin number (7–0).

Architecture

Figure 8 displays the interrupt controller block diagram.

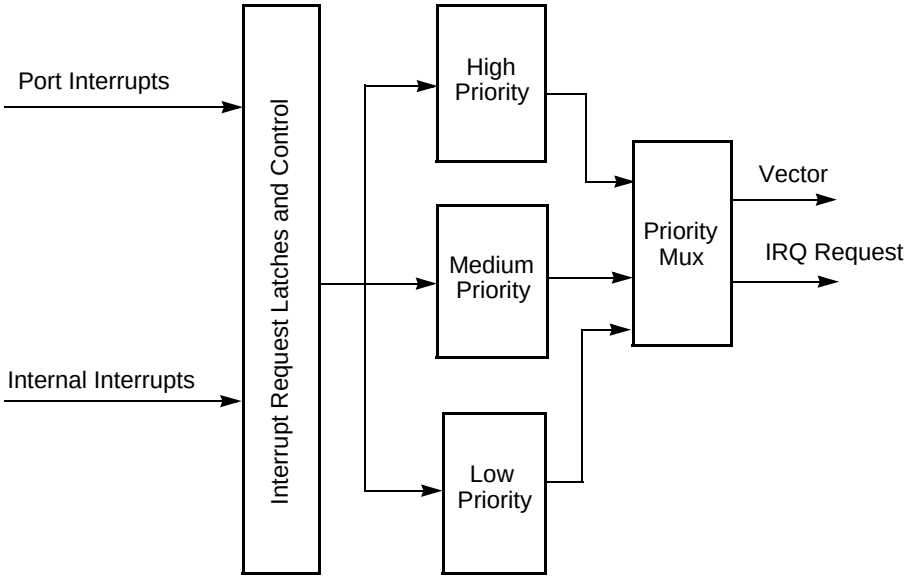

Figure 8. Interrupt Controller Block Diagram

Operation

This section describes the operational aspects of the following functions.

Master Interrupt Enable: see page 56

Interrupt Vectors and Priority: see page 57

Interrupt Assertion: see page 57

Software Interrupt Assertion: see page 58

Watchdog Timer Interrupt Assertion: see page 58

Master Interrupt Enable

The master interrupt enable bit (IRQE) in the Interrupt Control Register globally enables and disables interrupts.

Interrupts are globally enabled by any of the following actions:

- Execution of an Enable Interrupt (EI) instruction

Table 47. IRQ2 Enable Low Bit Register (IRQ2ENL)

Bit	7	6	5	4	3	2	1	0
Field	Reserved				C3ENL	C2ENL	C1ENL	C0ENL
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	FC8H							

Bit	Description
[7:4]	**Reserved** These bits are reserved and must be programmed to 0000.
[3] C3ENL	**Port C3 Interrupt Request Enable Low Bit**
[2] C2ENL	**Port C2 Interrupt Request Enable Low Bit**
[1] C1ENL	**Port C1 Interrupt Request Enable Low Bit**
[0] C0ENL	**Port C0 Interrupt Request Enable High Low**

Interrupt Edge Select Register

The Interrupt Edge Select (IRQES) Register (Table 48) determines whether an interrupt is generated for the rising edge or falling edge on the selected GPIO Port A or Port D input pin.

Table 48. Interrupt Edge Select Register (IRQES)

Bit	7	6	5	4	3	2	1	0
Field	IES7	IES6	IES5	IES4	IES3	IES2	IES1	IES0
RESET	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	FCDH							

Bit	Description
[7] IESx	**Interrupt Edge Select *x*** 0 = An interrupt request is generated on the falling edge of the PA*x* input or PDx. 1 = An interrupt request is generated on the rising edge of the PA*x* input PDx.

Note: *x* indicates the specific GPIO port pin number (7–0).

WDT Reset in NORMAL Operation

If configured to generate a Reset when a time-out occurs, the Watchdog Timer forces the device into the System Reset state. The WDT status bit in the Watchdog Timer Control Register is set to 1. For more information about System Reset, see **the** Reset and Stop Mode Recovery chapter on page 21.

WDT Reset in STOP Mode

If configured to generate a Reset when a time-out occurs and the device is in STOP Mode, the Watchdog Timer initiates a Stop Mode Recovery. Both the WDT status bit and the STOP bit in the Watchdog Timer Control Register are set to 1 following WDT time-out in STOP Mode. For more information, see **the** Reset and Stop Mode Recovery chapter on page 21.

Watchdog Timer Reload Unlock Sequence

Writing the unlock sequence to the Watchdog Timer Control Register (WDTCTL) address unlocks the three Watchdog Timer Reload Byte Registers (WDTU, WDTH, and WDTL) to allow changes to the time-out period. These write operations to the WDTCTL Register address produce no effect on the bits in the WDTCTL Register. The locking mechanism prevents spurious writes to the Reload registers. The following sequence is required to unlock the Watchdog Timer Reload Byte Registers (WDTU, WDTH, and WDTL) for write access.

1. Write 55H to the Watchdog Timer Control Register (WDTCTL).
2. Write AAH to the Watchdog Timer Control Register (WDTCTL).
3. Write the Watchdog Timer Reload Upper Byte register (WDTU).
4. Write the Watchdog Timer Reload High Byte register (WDTH).
5. Write the Watchdog Timer Reload Low Byte register (WDTL).

All three Watchdog Timer Reload registers must be written in the order just listed. There must be no other register writes between each of these operations. If a register write occurs, the lock state machine resets and no further writes can occur unless the sequence is restarted. The value in the Watchdog Timer Reload registers is loaded into the counter when the Watchdog Timer is first enabled and every time a WDT instruction is executed.

Watchdog Timer Control Register Definitions

This section defines the features of the following Watchdog Timer Control registers.

Watchdog Timer Control Register (WDTCTL): see page 94

Watchdog Timer Reload Upper Byte Register (WDTU): see page 95

UART Status 0 Register

The UART Status 0 and Status 1 registers (Table 66 and Table 67) identify the current UART operating configuration and status.

Table 66. UART Status 0 Register (U0STAT0)

Bit	7	6	5	4	3	2	1	0
Field	RDA	PE	OE	FE	BRKD	TDRE	TXE	CTS
RESET	0	0	0	0	0	1	1	X
R/W	R	R	R	R	R	R	R	R
Address	F41H							

Bit	Description
[7] RDA	**Receive Data Available** This bit indicates that the UART Receive Data Register has received data. Reading the UART Receive Data Register clears this bit. 0 = The UART Receive Data Register is empty. 1 = There is a byte in the UART Receive Data Register.
[6] PE	**Parity Error** This bit indicates that a parity error has occurred. Reading the UART Receive Data register clears this bit. 0 = No parity error has occurred. 1 = A parity error has occurred.
[5] OE	**Overrun Error** This bit indicates that an overrun error has occurred. An overrun occurs when new data is received and the UART Receive Data Register has not been read. If the RDA bit is reset to 0, reading the UART Receive Data Register clears this bit. 0 = No overrun error occurred. 1 = An overrun error occurred.
[4] FE	**Framing Error** This bit indicates that a framing error (no Stop bit following data reception) was detected. Reading the UART Receive Data Register clears this bit. 0 = No framing error occurred. 1 = A framing error occurred.
[3] BRKD	**Break Detect** This bit indicates that a break occurred. If the data bits, parity/multiprocessor bit, and Stop bit(s) are all 0s this bit is set to 1. Reading the UART Receive Data Register clears this bit. 0 = No break occurred. 1 = A break occurred.

The window remains open until the count again reaches 8 (that is, 24 baud clock periods since the previous pulse was detected), giving the endec a sampling window of minus four baud rate clocks to plus eight baud rate clocks around the expected time of an incoming pulse. If an incoming pulse is detected inside this window this process is repeated. If the incoming data is a logical 1 (no pulse), the endec returns to the initial state and waits for the next falling edge. As each falling edge is detected, the endec clock counter is reset, resynchronizing the endec to the incoming signal, allowing the endec to tolerate jitter and baud rate errors in the incoming datastream. Resynchronizing the endec does not alter the operation of the UART, which ultimately receives the data. The UART is only synchronized to the incoming data stream when a Start bit is received.

Infrared Encoder/Decoder Control Register Definitions

All infrared endec configuration and status information is set by the UART control registers as defined in the Universal Asynchronous Receiver/Transmitter chapter on page 97.

Caution: To prevent spurious signals during IrDA data transmission, set the IREN bit in the UART Control 1 Register to 1 to enable the endec before enabling the GPIO port alternate function for the corresponding pin.

4. When the first conversion in continuous operation is complete (after 5129 system clock cycles, plus the 40 cycles for power-up, if necessary), the ADC control logic performs the following operations:
   - CEN resets to 0 to indicate the first conversion is complete. CEN remains 0 for all subsequent conversions in continuous operation
   - An interrupt request is sent to the Interrupt Controller to indicate the conversion is complete

5. The ADC writes a new data result every 256 system clock cycles. For each completed conversion, the ADC control logic performs the following operations:
   - Writes the 11-bit two's complement result to {ADCD_H[7:0], ADCD_L[7:5]}
   - An interrupt request to the Interrupt Controller denoting conversion complete

6. To disable continuous conversion, clear the CONT bit in the ADC Control Register to 0.

Interrupts

The ADC is able to interrupt the CPU whenever a conversion has been completed and the ADC is enabled.

When the ADC is disabled, an interrupt is not asserted; however, an interrupt pending when the ADC is disabled is not cleared.

Calibration and Compensation

Z8 Encore! XP F0823 Series ADC can be factory calibrated for offset error and gain error, with the compensation data stored in Flash memory. Alternatively, user code can perform its own calibration, storing the values into Flash themselves.

Factory Calibration

Devices that have been factory calibrated contain nine bytes of calibration data in the Flash option bit space. This data consists of three bytes for each reference type. For a list of input modes for which calibration data exists, see the Zilog Calibration Data section on page 152. There is 1 byte for offset, and there are 2 bytes for gain correction.

User Calibration

If you have precision references available, its own external calibration can be performed, storing the values into Flash themselves.

Comparator Control Register Definition

The Comparator Control Register (CMPCTL) configures the comparator inputs and sets the value of the internal voltage reference.

Table 78. Comparator Control Register (CMP0)

Bit	7	6	5	4	3	2	1	0
Field	INPSEL	INNSEL	REFLVL				Reserved	
RESET	0	0	0	1	0	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Address	F90H							

Bit	Description
[7] INPSEL	**Signal Select for Positive Input** 0 = GPIO pin used as positive comparator input. 1 = temperature sensor used as positive comparator input.
[6] INNSEL	**Signal Select for Negative Input** 0 = internal reference disabled, GPIO pin used as negative comparator input. 1 = internal reference enabled as negative comparator input.
[5:2] REFLVL	**Internal Reference Voltage Level** 0000 = 0.0V. 0001 = 0.2V. 0010 = 0.4V. 0011 = 0.6V. 0100 = 0.8V. 0101 = 1.0V (Default). 0110 = 1.2V. 0111 = 1.4V. 1000 = 1.6V. 1001 = 1.8V. 1010–1111 = Reserved. **Note:** This reference is independent of the ADC voltage reference.
[1:0]	**Reserved** These bits are reserved; R/W bits must be programmed to 00 during writes and to 00 when read.

bits), framed between High bits. The auto-baud detector measures this period and sets the OCD baud rate generator accordingly.

The auto-baud detector/generator is clocked by the system clock. The minimum baud rate is the system clock frequency divided by 512. For optimal operation with asynchronous datastreams, the maximum recommended baud rate is the system clock frequency divided by eight. The maximum possible baud rate for asynchronous datastreams is the system clock frequency divided by four, but this theoretical maximum is possible only for low noise designs with clean signals. Table 100 lists minimum and recommended maximum baud rates for sample crystal frequencies.

Table 100. OCD Baud-Rate Limits

System Clock Frequency (MHz)	Recommended Maximum Baud Rate (kbps)	Recommended Standard PC Baud Rate (bps)	Minimum Baud Rate (kbps)
5.5296	1382.4	691,200	1.08
0.032768 (32kHz)	4.096	2400	0.064

If the OCD receives a Serial Break (nine or more continuous bits Low) the auto-baud detector/generator resets. Reconfigure the auto-baud detector/generator by sending 80H.

OCD Serial Errors

The OCD detects any of the following error conditions on the DBG pin:

- Serial Break (a minimum of nine continuous bits Low)
- Framing Error (received Stop bit is Low)
- Transmit Collision (OCD and host simultaneous transmission detected by the OCD)

When the OCD detects one of these errors, it aborts any command currently in progress, transmits a four character long Serial Break back to the host, and resets the auto-baud detector/generator. A Framing Error or Transmit Collision may be caused by the host sending a Serial Break to the OCD. Because of the open-drain nature of the interface, returning a Serial Break break back to the host only extends the length of the Serial Break if the host releases the Serial Break early.

The host transmits a Serial Break on the DBG pin when first connecting to the F0823 Series devices or when recovering from an error. A Serial Break from the host resets the auto-baud generator/detector but does not reset the OCD Control Register. A Serial Break leaves the device in DEBUG Mode if that is the current mode. The OCD is held in Reset until the end of the Serial Break when the DBG pin returns High. Because of the open-drain nature of the DBG pin, the host sends a Serial Break to the OCD even if the OCD is transmitting a character.

```
DBG ← 0BH
DBG ← Program Memory Address[15:8]
DBG ← Program Memory Address[7:0]
DBG ← Size[15:8]
DBG ← Size[7:0]
DBG → 1–65536 data bytes
```

Write Data Memory (0CH). The Write Data Memory command writes data to Data Memory. This command is equivalent to the LDE and LDEI instructions. Data can be written 1–65536 bytes at a time (65536 bytes can be written by setting size to 0). If the device is not in DEBUG Mode or if the Flash Read Protect Option Bit is enabled, the data is discarded.

```
DBG ← 0CH
DBG ← Data Memory Address[15:8]
DBG ← Data Memory Address[7:0]
DBG ← Size[15:8]
DBG ← Size[7:0]
DBG ← 1–65536 data bytes
```

Read Data Memory (0DH). The Read Data Memory command reads from Data Memory. This command is equivalent to the LDE and LDEI instructions. Data can be read 1 to 65536 bytes at a time (65536 bytes can be read by setting size to 0). If the device is not in DEBUG Mode, this command returns FFH for the data.

```
DBG ← 0DH
DBG ← Data Memory Address[15:8]
DBG ← Data Memory Address[7:0]
DBG ← Size[15:8]
DBG ← Size[7:0]
DBG → 1–65536 data bytes
```

Read Program Memory CRC (0EH). The Read Program Memory Cyclic Redundancy Check (CRC) command computes and returns the CRC of Program Memory using the 16-bit CRC-CCITT polynomial. If the device is not in DEBUG Mode, this command returns FFFFH for the CRC value. Unlike most other OCD Read commands, there is a delay from issuing of the command until the OCD returns the data. The OCD reads the Program Memory, calculates the CRC value, and returns the result. The delay is a function of the Program Memory size and is approximately equal to the system clock period multiplied by the number of bytes in the Program Memory.

```
DBG ← 0EH
DBG → CRC[15:8]
DBG → CRC[7:0]
```

Step Instruction (10H). The Step Instruction steps one assembly instruction at the current Program Counter (PC) location. If the device is not in DEBUG Mode or the Flash Read Protect Option bit is enabled, the OCD ignores this command.

```
DBG ← 10H
```

Table 110. Arithmetic Instructions (Continued)

Mnemonic	Operands	Instruction
MULT	dst	Multiply
SBC	dst, src	Subtract with Carry
SBCX	dst, src	Subtract with Carry using Extended Addressing

Note: Flags Notation:
* = Value is a function of the result of the operation.
– = Unaffected.
X = Undefined.
0 = Reset to 0.
1 = Set to 1.

DC Characteristics

Table 121 lists the DC characteristics of the Z8 Encore! XP F0823 Series products. All voltages are referenced to V_{SS}, the primary system ground.

Table 121. DC Characteristics

		T_A = –40°C to +105°C (unless otherwise specified)				
Symbol	**Parameter**	**Minimum**	**Typical**	**Maximum**	**Units**	**Conditions**
V_{DD}	Supply Voltage	2.7	–	3.6	V	
V_{IL1}	Low Level Input Voltage	–0.3	–	0.3*V_{DD}	V	
V_{IH1}	High Level Input Voltage	0.7*V_{DD}	–	5.5	V	For all input pins without analog or oscillator function. For all signal pins on the 8-pin devices. Programmable pull-ups must also be disabled.
V_{IH2}	High Level Input Voltage	0.7*V_{DD}	–	V_{DD}+0.3	V	For those pins with analog or oscillator function (20-/28-pin devices only), or when programmable pull-ups are enabled.
V_{OL1}	Low Level Output Voltage	–	–	0.4	V	I_{OL} = 2mA; V_{DD} = 3.0V High Output Drive disabled.
V_{OH1}	High Level Output Voltage	2.4	–	–	V	I_{OH} = –2mA; V_{DD} = 3.0V High Output Drive disabled.
V_{OL2}	Low Level Output Voltage	–	–	0.6	V	I_{OL} = 20mA; V_{DD} = 3.3 V High Output Drive enabled.
V_{OH2}	High Level Output Voltage	2.4	–	–	V	I_{OH} = –20mA; V_{DD} = 3.3 V High Output Drive enabled.
I_{IH}	Input Leakage Current	–	±0.002	±5	µA	V_{IN} = V_{DD} V_{DD} = 3.3 V
I_{IL}	Input Leakage Current	–	±0.007	±5	µA	V_{IN} = V_{SS} V_{DD} = 3.3 V
I_{TL}	Tristate Leakage Current	–	–	±5	µA	

Notes:
1. This condition excludes all pins that have on-chip pull-ups, when driven Low.
2. These values are provided for design guidance only and are not tested in production.

Ordering Information

Order your F0823 Series products from Zilog using the part numbers shown in Table 135. For more information about ordering, please consult your local Zilog sales office. The Sales Location page on the Zilog website lists all regional offices.

Table 135. Z8 Encore! XP F0823 Series Ordering Matrix

Part Number	Flash	RAM	I/O Lines	Interrupts	16-Bit Timers w/PWM	10-Bit A/D Channels	UART with IrDA	Description
Z8 Encore! XP F0823 Series with 8 KB Flash, 10-Bit Analog-to-Digital Converter								
Standard Temperature: 0°C to 70°C								
Z8F0823PB005SG	8 KB	1 KB	6	12	2	4	1	PDIP 8-pin package
