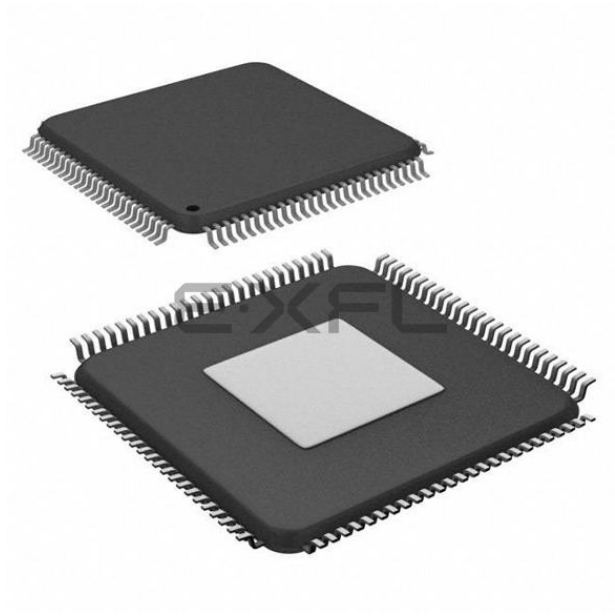
Infineon Technologies - XC2265N40F80LABKXUMA1 Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	C166SV2
Core Size	16/32-Bit
Speed	80MHz
Connectivity	CANbus, EBI/EMI, I²C, LINbus, SPI, SSC, UART/USART, USI
Peripherals	I²S, POR, PWM, WDT
Number of I/O	76
Program Memory Size	320KB (320K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	42K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 5.5V
Data Converters	A/D 16x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	100-LQFP Exposed Pad
Supplier Device Package	PG-LQFP-100-8
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/xc2265n40f80labkxuma1

16/32-Bit

Architecture

XC2261N/68N, XC2263N/64N/65N

16/32-Bit Single-Chip Microcontroller
with 32-Bit Performance
XC2000 Family / Value Line

Data Sheet

V1.4 2011-07

Microcontrollers

4.6 Flash Memory Parameters 95
4.7 AC Parameters 97
4.7.1 Testing Waveforms 97
4.7.2 Definition of Internal Timing 98
4.7.2.1 Phase Locked Loop (PLL) 99
4.7.2.2 Wakeup Clock 102
4.7.2.3 Selecting and Changing the Operating Frequency 102
4.7.3 External Clock Input Parameters 103
4.7.4 Pad Properties 105
4.7.5 External Bus Timing 109
4.7.5.1 Bus Cycle Control with the READY Input 114
4.7.6 Synchronous Serial Interface Timing 117
4.7.7 Debug Interface Timing 121

5 Package and Reliability 127
5.1 Packaging 127
5.2 Thermal Considerations 129
5.3 Quality Declarations 130

- On-Chip Peripheral Modules
  - Two synchronizable A/D Converters with up to 16 channels, 10-bit resolution, conversion time below 1 µs, optional data preprocessing (data reduction, range check), broken wire detection
  - 16-channel general purpose capture/compare unit (CC2)
  - Two capture/compare units for flexible PWM signal generation (CCU6x)
  - Multi-functional general purpose timer unit with 5 timers
  - Up to 6 serial interface channels to be used as UART, LIN, high-speed synchronous channel (SPI/QSPI), IIC bus interface (10-bit addressing, 400 kbit/s), IIS interface
  - On-chip MultiCAN interface (Rev. 2.0B active) with up to 256 message objects (Full CAN/Basic CAN) on up to 6 CAN nodes and gateway functionality
  - On-chip system timer and on-chip real time clock
- Up to 12 Mbytes external address space for code and data
  - Programmable external bus characteristics for different address ranges
  - Multiplexed or demultiplexed external address/data buses
  - Selectable address bus width
  - 16-bit or 8-bit data bus width
  - Four programmable chip-select signals
- Single power supply from 3.0 V to 5.5 V
- Power reduction and wake-up modes with flexible power management
- Programmable watchdog timer and oscillator watchdog
- Up to 76 general purpose I/O lines
- On-chip bootstrap loaders
- Supported by a full range of development tools including C compilers, macro-assembler packages, emulators, evaluation boards, HLL debuggers, simulators, logic analyzer disassemblers, programming boards
- On-chip debug support via Device Access Port (DAP) or JTAG interface
- 100-pin Green LQFP package, 0.5 mm (19.7 mil) pitch

Table 6 Pin Definitions and Functions (cont'd)

Pin	Symbol	Ctrl.	Type	Function
65	P2.13	O0 / I	St/B	**Bit 13 of Port 2, General Purpose Input/Output**
	U2C1_SELO 2	O1	St/B	**USIC2 Channel 1 Select/Control 2 Output**
	RxDC2D	I	St/B	**CAN Node 2 Receive Data Input**
66	P2.10	O0 / I	St/B	**Bit 10 of Port 2, General Purpose Input/Output**
	U0C1_DOUT	O1	St/B	**USIC0 Channel 1 Shift Data Output**
	U0C0_SELO 3	O2	St/B	**USIC0 Channel 0 Select/Control 3 Output**

Table 8 XC226xN Memory Map (cont'd)[1)]

Address Area	Start Loc.	End Loc.	Area Size[2)]	Notes
Reserved for DSRAM	$00'8000_H$	$00'9FFF_H$	8 Kbytes	
External memory area	$00'0000_H$	$00'7FFF_H$	32 Kbytes	

1) Accesses to the shaded areas are reserved. In devices with external bus interface these accesses generate external bus accesses.

2) The areas marked with "<" are slightly smaller than indicated, see column "Notes".

3) The uppermost 4-Kbyte sector of the first Flash segment is reserved for internal use ($C0'F000_H$ to $C0'FFFF_H$).

4) Several pipeline optimizations are not active within the external IO area. This is necessary to control external peripherals properly.

This common memory space consists of 16 Mbytes organized as 256 segments of 64 Kbytes; each segment contains four data pages of 16 Kbytes. The entire memory space can be accessed bytewise or wordwise. Portions of the on-chip DPRAM and the register spaces (ESFR/SFR) additionally are directly bit addressable.

The internal data memory areas and the Special Function Register areas (SFR and ESFR) are mapped into segment 0, the system segment.

The Program Management Unit (PMU) handles all code fetches and, therefore, controls access to the program memories such as Flash memory and PSRAM.

The Data Management Unit (DMU) handles all data transfers and, therefore, controls access to the DSRAM and the on-chip peripherals.

Both units (PMU and DMU) are connected to the high-speed system bus so that they can exchange data. This is required if operands are read from program memory, code or data is written to the PSRAM, code is fetched from external memory, or data is read from or written to external resources. These include peripherals on the LXBus such as USIC or MultiCAN. The system bus allows concurrent two-way communication for maximum transfer performance.

Up to 16 Kbytes of on-chip Program SRAM (PSRAM) are provided to store user code or data. The PSRAM is accessed via the PMU and is optimized for code fetches. A section of the PSRAM with programmable size can be write-protected.

Note: The actual size of the PSRAM depends on the quoted device type.

3.4 Memory Protection Unit (MPU)

The XC226xN's Memory Protection Unit (MPU) protects user-specified memory areas from unauthorized read, write, or instruction fetch accesses. The MPU can protect the whole address space including the peripheral area. This completes established mechanisms such as the register security mechanism or stack overrun/underrun detection.

Four Protection Levels support flexible system programming where operating system, low level drivers, and applications run on separate levels. Each protection level permits different access restrictions for instructions and/or data.

Every access is checked (if the MPU is enabled) and an access violating the permission rules will be marked as invalid and leads to a protection trap.

A set of protection registers for each protection level specifies the address ranges and the access permissions. Applications requiring more than 4 protection levels can dynamically re-program the protection registers.

3.5 Memory Checker Module (MCHK)

The XC226xN's Memory Checker Module calculates a checksum (fractional polynomial division) on a block of data, often called Cyclic Redundancy Code (CRC). It is based on a 32-bit linear feedback shift register and may, therefore, also be used to generate pseudo-random numbers.

The Memory Checker Module is a 16-bit parallel input signature compression circuitry which enables error detection within a block of data stored in memory, registers, or communicated e.g. via serial communication lines. It reduces the probability of error masking due to repeated error patterns by calculating the signature of blocks of data.

The polynomial used for operation is configurable, so most of the commonly used polynomials may be used. Also, the block size for generating a CRC result is configurable via a local counter. An interrupt may be generated if testing the current data block reveals an error.

An autonomous CRC compare circuitry is included to enable redundant error detection, e.g. to enable higher safety integrity levels.

The Memory Checker Module provides enhanced fault detection (beyond parity or ECC) for data and instructions in volatile and non volatile memories. This is especially important for the safety and reliability of embedded systems.

Table 9 Compare Modes (cont'd)

Compare Modes	Function
Mode 2	Interrupt-only compare mode; Only one compare interrupt per timer period is generated
Mode 3	Pin set '1' on match; pin reset '0' on compare timer overflow; Only one compare event per timer period is generated
Double Register Mode	Two registers operate on one pin; Pin toggles on each compare match; Several compare events per timer period are possible
Single Event Mode	Generates single edges or pulses; Can be used with any compare mode

When a capture/compare register has been selected for capture mode, the current contents of the allocated timer will be latched ('captured') into the capture/compare register in response to an external event at the port pin associated with this register. In addition, a specific interrupt request for this capture/compare register is generated. Either a positive, a negative, or both a positive and a negative external signal transition at the pin can be selected as the triggering event.

The contents of all registers selected for one of the five compare modes are continuously compared with the contents of the allocated timers.

When a match occurs between the timer value and the value in a capture/compare register, specific actions will be taken based on the compare mode selected.

4 Electrical Parameters

The operating range for the XC226xN is defined by its electrical parameters. For proper operation the specified limits must be respected when integrating the device in its target environment.

4.1 General Parameters

These parameters are valid for all subsequent descriptions, unless otherwise noted.

Table 12 Absolute Maximum Rating Parameters

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Output current on a pin when high value is driven	I_{OH} SR	-30	–	–	mA	
Output current on a pin when low value is driven	I_{OL} SR	–	–	30	mA	
Overload current	I_{OV} SR	-10	–	10	mA	1)
Absolute sum of overload currents	$\Sigma\|I_{OV}\|$ SR	–	–	100	mA	1)
Junction Temperature	T_J SR	-40	–	150	°C	
Storage Temperature	T_{ST} SR	-65	–	150	°C	
Digital supply voltage for IO pads and voltage regulators	V_{DDP} SR	-0.5	–	6.0	V	
Voltage on any pin with respect to ground (Vss)	V_{IN} SR	-0.5	–	V_{DDP} + 0.5	V	$V_{IN} \leq V_{DDP(max)}$

1) Overload condition occurs if the input voltage V_{IN} is out of the absolute maximum rating range. In this case the current must be limited to the listed values by design measures.

Note: Stresses above the values listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for an extended time may affect device reliability.
During absolute maximum rating overload conditions ($V_{IN} > V_{DDP}$ or $V_{IN} < V_{SS}$) the voltage on V_{DDP} pins with respect to ground (V_{SS}) must not exceed the values defined by the absolute maximum ratings.

4.1.1 Operating Conditions

The following operating conditions must not be exceeded to ensure correct operation of the XC226xN. All parameters specified in the following sections refer to these operating conditions, unless otherwise noticed.

Note: Typical parameter values refer to room temperature and nominal supply voltage, minimum/maximum parameter values also include conditions of minimum/maximum temperature and minimum/maximum supply voltage. Additional details are described where applicable.

Table 13 Operating Conditions

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Voltage Regulator Buffer Capacitance for DMP_M	C_{EVRM} SR	1.0	–	4.7	µF	[1]
Voltage Regulator Buffer Capacitance for DMP_1	C_{EVR1} SR	0.47	–	2.2	µF	[2][1]
External Load Capacitance	C_L SR	–	20[3]	–	pF	pin out driver= default [4]
System frequency	f_{SYS} SR	–	–	80	MHz	[5]
Overload current for analog inputs[6]	I_{OVA} SR	-2	–	5	mA	not subject to production test
Overload current for digital inputs[6]	I_{OVD} SR	-5	–	5	mA	not subject to production test
Overload current coupling factor for analog inputs[7]	K_{OVA} CC	–	2.5×10^{-4}	1.5×10^{-3}	-	I_{OV}< 0 mA; not subject to production test
		–	1.0×10^{-6}	1.0×10^{-4}	-	I_{OV}> 0 mA; not subject to production test

4.3.1 DC Parameters for Upper Voltage Area

Keeping signal levels within the limits specified in this table ensures operation without overload conditions. For signal levels outside these specifications, also refer to the specification of the overload current I_{OV}.

Note: Operating Conditions apply.

Table 16 is valid under the following conditions: $V_{DDP} \leq$ 5.5 V; V_{DDP}typ. 5 V; $V_{DDP} \geq$ 4.5 V

Table 16 DC Characteristics for Upper Voltage Range

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Pin capacitance (digital inputs/outputs). To be doubled for double bond pins.[1)]	C_{IO} CC	–	–	10	pF	not subject to production test
Input Hysteresis[2)]	HYS CC	0.11 x V_{DDP}	–	–	V	R_S= 0 Ohm
Absolute input leakage current on pins of analog ports[3)]	$\|I_{OZ1}\|$ CC	–	10	200	nA	$V_{IN} > V_{SS}$; $V_{IN} < V_{DDP}$
Absolute input leakage current for all other pins. To be doubled for double bond pins.[3)1)4)]	$\|I_{OZ2}\|$ CC	–	0.2	5	µA	$T_J \leq$ 110 °C; $V_{IN} > V_{SS}$; $V_{IN} < V_{DDP}$
		–	0.2	15	µA	$T_J \leq$ 150 °C; $V_{IN} > V_{SS}$; $V_{IN} < V_{DDP}$
Pull Level Force Current[5)]	$\|I_{PLF}\|$ SR	250	–	–	µA	$V_{IN} \geq V_{IHmin}$*(pull down_enabled)*; $V_{IN} \leq V_{ILmax}$*(pull up_enabled)*
Pull Level Keep Current[6)]	$\|I_{PLK}\|$ SR	–	–	30	µA	$V_{IN} \geq V_{IHmin}$*(pull up_enabled)*; $V_{IN} \leq V_{ILmax}$*(pull down_enabled)*
Input high voltage (all except XTAL1)	V_{IH} SR	0.7 x V_{DDP}	–	V_{DDP} + 0.3	V	
Input low voltage (all except XTAL1)	V_{IL} SR	-0.3	–	0.3 x V_{DDP}	V	

Sample time and conversion time of the XC226xN's A/D converters are programmable. The timing above can be calculated using **Table 21**.
The limit values for f_{ADCI} must not be exceeded when selecting the prescaler value.

Table 21 A/D Converter Computation Table

GLOBCTR.5-0 (DIVA)	A/D Converter Analog Clock f_{ADCI}	INPCRx.7-0 (STC)	Sample Time[1] t_S
000000_B	f_{SYS}	00_H	$t_{ADCI} \times 2$
000001_B	f_{SYS} / 2	01_H	$t_{ADCI} \times 3$
000010_B	f_{SYS} / 3	02_H	$t_{ADCI} \times 4$
:	f_{SYS} / (DIVA+1)	:	$t_{ADCI} \times$ (STC+2)
111110_B	f_{SYS} / 63	FE_H	$t_{ADCI} \times 256$
111111_B	f_{SYS} / 64	FF_H	$t_{ADCI} \times 257$

1) The selected sample time is doubled if broken wire detection is active (due to the presampling phase).

Converter Timing Example A:

Assumptions: f_{SYS} = 80 MHz (i.e. t_{SYS} = 12.5 ns), DIVA = 03_H, STC = 00_H
Analog clock f_{ADCI} = f_{SYS} / 4 = 20 MHz, i.e. t_{ADCI} = 50 ns
Sample time t_S = $t_{ADCI} \times 2$ = 100 ns

Conversion 10-bit:

$t_{C10} = 13 \times t_{ADCI} + 2 \times t_{SYS} = 13 \times 50\text{ ns} + 2 \times 12.5\text{ ns} = 0.675\ \mu s$

Conversion 8-bit:

$t_{C8} = 11 \times t_{ADCI} + 2 \times t_{SYS} = 11 \times 50\text{ ns} + 2 \times 12.5\text{ ns} = 0.575\ \mu s$

Converter Timing Example B:

Assumptions: f_{SYS} = 40 MHz (i.e. t_{SYS} = 25 ns), DIVA = 02_H, STC = 03_H
Analog clock f_{ADCI} = f_{SYS} / 3 = 13.3 MHz, i.e. t_{ADCI} = 75 ns
Sample time t_S = $t_{ADCI} \times 5$ = 375 ns

Conversion 10-bit:

$t_{C10} = 16 \times t_{ADCI} + 2 \times t_{SYS} = 16 \times 75\text{ ns} + 2 \times 25\text{ ns} = 1.25\ \mu s$

Conversion 8-bit:

$t_{C8} = 14 \times t_{ADCI} + 2 \times t_{SYS} = 14 \times 75\text{ ns} + 2 \times 25\text{ ns} = 1.10\ \mu s$

Table 25 Flash Parameters (cont'd)

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Number of erase cycles	N_{ER} SR	–	–	15.000	cycles	$t_{RET} \geq$ 5 years; Valid for up to 64 user selected sectors (data storage)
		–	–	1.000	cycles	$t_{RET} \geq$ 20 years

1) The unused Flash module(s) can be erased/programmed while code is executed and/or data is read from only one Flash module or from PSRAM. The Flash module that delivers code/data can, of course, not be erased/programmed.
2) Flash module 1 can be erased/programmed while code is executed and/or data is read from Flash module 0.
3) Value of IMB_IMBCTRL.WSFLASH.
4) Programming and erase times depend on the internal Flash clock source. The control state machine needs a few system clock cycles. This increases the stated durations noticably only at extremely low system clock frequencies.

Access to the XC226xN Flash modules is controlled by the IMB. Built-in prefetch mechanisms optimize the performance for sequential access.

Flash access waitstates only affect non-sequential access. Due to prefetch mechanisms, the performance for sequential access (depending on the software structure) is only partially influenced by waitstates.

Direct Drive

When direct drive operation is selected (SYSCON0.CLKSEL = 11_B), the system clock is derived directly from the input clock signal CLKIN1:

$f_{SYS} = f_{IN}$.

The frequency of f_{SYS} is the same as the frequency of f_{IN}. In this case the high and low times of f_{SYS} are determined by the duty cycle of the input clock f_{IN}.

Selecting Bypass Operation from the XTAL1[1)] input and using a divider factor of 1 results in a similar configuration.

Prescaler Operation

When prescaler operation is selected (SYSCON0.CLKSEL = 10_B, PLLCON0.VCOBY = 1_B), the system clock is derived either from the crystal oscillator (input clock signal XTAL1) or from the internal clock source through the output prescaler K1 (= K1DIV+1):

$f_{SYS} = f_{OSC}$ / K1.

If a divider factor of 1 is selected, the frequency of f_{SYS} equals the frequency of f_{OSC}. In this case the high and low times of f_{SYS} are determined by the duty cycle of the input clock f_{OSC} (external or internal).

The lowest system clock frequency results from selecting the maximum value for the divider factor K1:

$f_{SYS} = f_{OSC}$ / 1024.

4.7.2.1 Phase Locked Loop (PLL)

When PLL operation is selected (SYSCON0.CLKSEL = 10_B, PLLCON0.VCOBY = 0_B), the on-chip phase locked loop is enabled and provides the system clock. The PLL multiplies the input frequency by the factor **F** ($f_{SYS} = f_{IN} \times$ **F**).
F is calculated from the input divider P (= PDIV+1), the multiplication factor N (= NDIV+1), and the output divider K2 (= K2DIV+1):
(**F** = N / (P $\times$ K2)).

The input clock can be derived either from an external source at XTAL1 or from the on-chip clock source.

The PLL circuit synchronizes the system clock to the input clock. This synchronization is performed smoothly so that the system clock frequency does not change abruptly.

Adjustment to the input clock continuously changes the frequency of f_{SYS} so that it is locked to f_{IN}. The slight variation causes a jitter of f_{SYS} which in turn affects the duration of individual TCSs.

1) Voltages on XTAL1 must comply to the core supply voltage V_{DDIM}.

Table 33 External Bus Timing for Lower Voltage Range

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Output valid delay for $\overline{RD}$, $\overline{WR}$(L/H)	t_{10} CC	–	11	20	ns	
Output valid delay for $\overline{BHE}$, ALE	t_{11} CC	–	10	21	ns	
Address output valid delay for A23 ... A0	t_{12} CC	–	11	22	ns	
Address output valid delay for AD15 ... AD0 (MUX mode)	t_{13} CC	–	10	22	ns	
Output valid delay for $\overline{CS}$	t_{14} CC	–	10	13	ns	
Data output valid delay for AD15 ... AD0 (write data, MUX mode)	t_{15} CC	–	10	22	ns	
Data output valid delay for D15 ... D0 (write data, DEMUX mode)	t_{16} CC	–	10	22	ns	
Output hold time for $\overline{RD}$, $\overline{WR}$(L/H)	t_{20} CC	-2	8	10	ns	
Output hold time for $\overline{BHE}$, ALE	t_{21} CC	-2	8	10	ns	
Address output hold time for AD15 ... AD0	t_{23} CC	-3	8	10	ns	
Output hold time for $\overline{CS}$	t_{24} CC	-3	8	11	ns	
Data output hold time for D15 ... D0 and AD15 ... AD0	t_{25} CC	-3	8	10	ns	
Input setup time for READY, D15 ... D0, AD15 ... AD0	t_{30} SR	29	17	–	ns	
Input hold time READY, D15 ... D0, AD15 ... AD0[1)]	t_{31} SR	0	-9	–	ns	

1) Read data are latched with the same internal clock edge that triggers the address change and the rising edge of RD. Address changes before the end of RD have no impact on (demultiplexed) read cycles. Read data can change after the rising edge of RD.

4.7.6 Synchronous Serial Interface Timing

The following parameters are applicable for a USIC channel operated in SSC mode.

Note: These parameters are not subject to production test but verified by design and/or characterization.

Note: Operating Conditions apply.

Table 34 is valid under the following conditions: C_L= 20 pF; *SSC*= master ; voltage_range= upper

Table 34 USIC SSC Master Mode Timing for Upper Voltage Range

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Slave select output SELO active to first SCLKOUT transmit edge	t_1 CC	t_{SYS} - 8[1)]	–	–	ns	
Slave select output SELO inactive after last SCLKOUT receive edge	t_2 CC	t_{SYS} - 6[1)]	–	–	ns	
Data output DOUT valid time	t_3 CC	-6	–	9	ns	
Receive data input setup time to SCLKOUT receive edge	t_4 SR	31	–	–	ns	
Data input DX0 hold time from SCLKOUT receive edge	t_5 SR	-4	–	–	ns	

1) $t_{SYS} = 1 / f_{SYS}$

Table 35 is valid under the following conditions: C_L= 20 pF; *SSC*= master ; voltage_range= lower

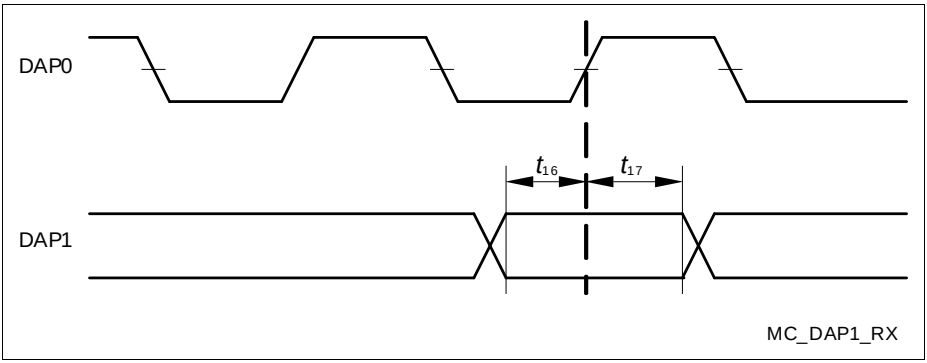

Figure 28 DAP Timing Host to Device

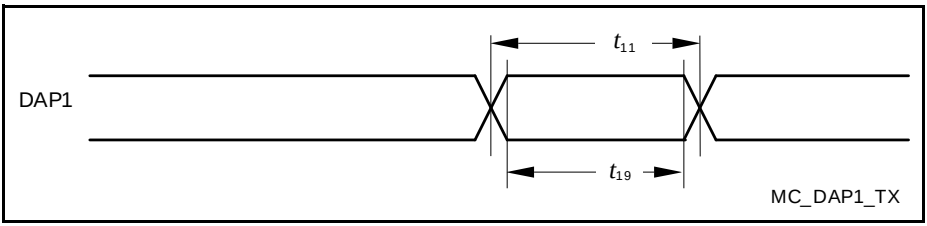

Figure 29 DAP Timing Device to Host

Note: The transmission timing is determined by the receiving debugger by evaluating the sync-request synchronization pattern telegram.

Debug via JTAG

The following parameters are applicable for communication through the JTAG debug interface. The JTAG module is fully compliant with IEEE1149.1-2000.

Note: These parameters are not subject to production test but verified by design and/or characterization.

Note: Operating Conditions apply.

Table 40 is valid under the following conditions: C_L= 20 pF; voltage_range= upper

Table 40 JTAG Interface Timing for Upper Voltage Range

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
TCK clock period	t_1 SR	50	–	–	ns	[1]
TCK high time	t_2 SR	16	–	–	ns	

5 Package and Reliability

The XC2000 Family devices use the package type PG-LQFP (Plastic Green - Low Profile Quad Flat Package). The following specifications must be regarded to ensure proper integration of the XC226xN in its target environment.

5.1 Packaging

These parameters specify the packaging rather than the silicon.

Table 42 Package Parameters (PG-LQFP-100-8)

Parameter	Symbol	Limit Values		Unit	Notes
		Min.	Max.		
Exposed Pad Dimension	Ex × Ey	–	5.2 × 5.2	mm	–
Power Dissipation	P_{DISS}	–	0.8	W	–
Thermal resistance Junction-Ambient	$R_{\Theta JA}$	–	54	K/W	No thermal via[1)]
			49	K/W	4-layer, no pad[2)]
			27	K/W	4-layer, pad[3)]

1) Device mounted on a 4-layer board without thermal vias; exposed pad not soldered.

2) Device mounted on a 4-layer JEDEC board (according to JESD 51-7) with thermal vias; exposed pad not soldered.

3) Device mounted on a 4-layer JEDEC board (according to JESD 51-7) with thermal vias; exposed pad soldered to the board.

Note: To improve the EMC behavior, it is recommended to connect the exposed pad to the board ground, independent of the thermal requirements.
Board layout examples are given in an application note.

Package Compatibility Considerations

The XC226xN is a member of the XC2000 Family of microcontrollers. It is also compatible to a certain extent with members of similar families or subfamilies.

Each package is optimized for the device it houses. Therefore, there may be slight differences between packages of the same pin-count but for different device types. In particular, the size of the Exposed Pad (if present) may vary.

If different device types are considered or planned for an application, it must be ensured that the board layout fits all packages under consideration.
