Understanding [Embedded - CPLDs (Complex Programmable Logic Devices)](#)

Embedded - CPLDs, or Complex Programmable Logic Devices, are highly versatile digital logic devices used in electronic systems. These programmable components are designed to perform complex logical operations and can be customized for specific applications. Unlike fixed-function ICs, CPLDs offer the flexibility to reprogram their configuration, making them an ideal choice for various embedded systems. They consist of a set of logic gates and programmable interconnects, allowing designers to implement complex logic circuits without needing custom hardware.

Applications of Embedded - CPLDs

Details	
Product Status	Obsolete
Programmable Type	In System Programmable
Delay Time tpd(1) Max	7.5 ns
Voltage Supply - Internal	3V ~ 3.6V
Number of Logic Elements/Blocks	4
Number of Macrocells	64
Number of Gates	1250
Number of I/O	36
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	44-TQFP
Supplier Device Package	44-TQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/intel/epm7064aetc44-7

MAX 7000A devices use CMOS EEPROM cells to implement logic functions. The user-configurable MAX 7000A architecture accommodates a variety of independent combinatorial and sequential logic functions. The devices can be reprogrammed for quick and efficient iterations during design development and debug cycles, and can be programmed and erased up to 100 times.
MAX 7000A devices contain from 32 to 512 macrocells that are combined into groups of 16 macrocells, called logic array blocks (LABs). Each macrocell has a programmable-AND/fixed-OR array and a configurable register with independently programmable clock, clock enable, clear, and preset functions. To build complex logic functions, each macrocell can be supplemented with both shareable expander product terms and high-speed parallel expander product terms, providing up to 32 product terms per macrocell.

MAX 7000A devices provide programmable speed/power optimization. Speed-critical portions of a design can run at high speed/full power, while the remaining portions run at reduced speed/low power. This speed/power optimization feature enables the designer to configure one or more macrocells to operate at 50% or lower power while adding only a nominal timing delay. MAX 7000A devices also provide an option that reduces the slew rate of the output buffers, minimizing noise transients when non-speed-critical signals are switching. The output drivers of all MAX 7000A devices can be set for 2.5 V or 3.3 V, and all input pins are 2.5-V, 3.3-V, and 5.0-V tolerant, allowing MAX 7000A devices to be used in mixed-voltage systems.

MAX 7000A devices are supported by Altera development systems, which are integrated packages that offer schematic, text—including VHDL, Verilog HDL, and the Altera Hardware Description Language (AHDL)—and waveform design entry, compilation and logic synthesis, simulation and timing analysis, and device programming. The software provides EDIF 2 0 0 and 3 0 0, LPM, VHDL, Verilog HDL, and other interfaces for additional design entry and simulation support from other industry-standard PC- and UNIX-workstation-based EDA tools. The software runs on Windows-based PCs, as well as Sun SPARCstation, and HP 9000 Series 700/800 workstations.

For more information on development tools, see the *MAX+PLUS II Programmable Logic Development System & Software Data Sheet* and the *Quartus Programmable Logic Development System & Software Data Sheet*.

Logic Array Blocks

The MAX 7000A device architecture is based on the linking of high-performance LABs. LABs consist of 16-macrocell arrays, as shown in Figure 1. Multiple LABs are linked together via the PIA, a global bus that is fed by all dedicated input pins, I/O pins, and macrocells.

Each LAB is fed by the following signals:

■　36 signals from the PIA that are used for general logic inputs
■　Global controls that are used for secondary register functions
■　Direct input paths from I/O pins to the registers that are used for fast setup times

For registered functions, each macrocell flipflop can be individually programmed to implement D, T, JK, or SR operation with programmable clock control. The flipflop can be bypassed for combinatorial operation. During design entry, the designer specifies the desired flipflop type; the Altera software then selects the most efficient flipflop operation for each registered function to optimize resource utilization.

Each programmable register can be clocked in three different modes:

- Global clock signal. This mode achieves the fastest clock-to-output performance.
- Global clock signal enabled by an active-high clock enable. A clock enable is generated by a product term. This mode provides an enable on each flipflop while still achieving the fast clock-to-output performance of the global clock.
- Array clock implemented with a product term. In this mode, the flipflop can be clocked by signals from buried macrocells or I/O pins.

Two global clock signals are available in MAX 7000A devices. As shown in Figure 1, these global clock signals can be the true or the complement of either of the global clock pins, GCLK1 or GCLK2.

Each register also supports asynchronous preset and clear functions. As shown in Figure 2, the product-term select matrix allocates product terms to control these operations. Although the product-term-driven preset and clear from the register are active high, active-low control can be obtained by inverting the signal within the logic array. In addition, each register clear function can be individually driven by the active-low dedicated global clear pin (GCLRn). Upon power-up, each register in a MAX 7000AE device may be set to either a high or low state. This power-up state is specified at design entry. Upon power-up, each register in EPM7128A and EPM7256A devices are set to a low state.

All MAX 7000A I/O pins have a fast input path to a macrocell register. This dedicated path allows a signal to bypass the PIA and combinatorial logic and be clocked to an input D flipflop with an extremely fast (as low as 2.5 ns) input setup time.

Expander Product Terms

Although most logic functions can be implemented with the five product terms available in each macrocell, more complex logic functions require additional product terms. Another macrocell can be used to supply the required logic resources. However, the MAX 7000A architecture also offers both shareable and parallel expander product terms that provide additional product terms directly to any macrocell in the same LAB. These expanders help ensure that logic is synthesized with the fewest possible logic resources to obtain the fastest possible speed.

Shareable Expanders

Each LAB has 16 shareable expanders that can be viewed as a pool of uncommitted single product terms (one from each macrocell) with inverted outputs that feed back into the logic array. Each shareable expander can be used and shared by any or all macrocells in the LAB to build complex logic functions. A small delay (t_{SEXP}) is incurred when shareable expanders are used. Figure 3 shows how shareable expanders can feed multiple macrocells.

Figure 3. MAX 7000A Shareable Expanders

Shareable expanders can be shared by any or all macrocells in an LAB.

Figure 6. I/O Control Block of MAX 7000A Devices
Note:
(1)   EPM7032AE, EPM7064AE, EPM7128A, EPM7128AE, EPM7256A, and EPM7256AE devices have six output enable signals. EPM7512AE devices have 10 output enable signals.

When the tri-state buffer control is connected to ground, the output is tri-stated (high impedance) and the I/O pin can be used as a dedicated input. When the tri-state buffer control is connected to V_{CC}, the output is enabled.

The MAX 7000A architecture provides dual I/O feedback, in which macrocell and pin feedbacks are independent. When an I/O pin is configured as an input, the associated macrocell can be used for buried logic.

The programming times described in Tables 5 through 7 are associated with the worst-case method using the enhanced ISP algorithm.

Table 5. MAX 7000A t_{PULSE} & Cycle$_{TCK}$ Values

Device	Programming		Stand-Alone Verification	
	t_{PPULSE} (s)	Cycle$_{PTCK}$	t_{VPULSE} (s)	Cycle$_{VTCK}$
EPM7032AE	2.00	55,000	0.002	18,000
EPM7064AE	2.00	105,000	0.002	35,000
EPM7128AE	2.00	205,000	0.002	68,000

EPM7128A *(1)*	0.08	0.14	0.29	0.56	1.09	2.67	5.31	10.59	s
EPM7256A *(1)*	0.13	0.24	0.54	1.06	2.08	5.15	10.27	20.51	s

Note to tables:

(1) EPM7128A and EPM7256A devices can only be programmed with an adaptive algorithm; users programming these two devices on platforms that cannot use an adaptive algorithm should use EPM7128AE and EPM7256AE devices.

Programming with External Hardware

MAX 7000A devices can be programmed on Windows-based PCs with an Altera Logic Programmer card, the MPU, and the appropriate device adapter. The MPU performs continuity checks to ensure adequate electrical contact between the adapter and the device.

For more information, see the *Altera Programming Hardware Data Sheet*.

The Altera software can use text- or waveform-format test vectors created with the Altera Text Editor or Waveform Editor to test the programmed device. For added design verification, designers can perform functional testing to compare the functional device behavior with the results of simulation.

Data I/O, BP Microsystems, and other programming hardware manufacturers provide programming support for Altera devices.

For more information, see *Programming Hardware Manufacturers*.

IEEE Std. 1149.1 (JTAG) Boundary-Scan Support

MAX 7000A devices include the JTAG BST circuitry defined by IEEE Std. 1149.1. Table 8 describes the JTAG instructions supported by MAX 7000A devices. The pin-out tables, available from the Altera web site (**http://www.altera.com**), show the location of the JTAG control pins for each device. If the JTAG interface is not required, the JTAG pins are available as user I/O pins.

Power Sequencing & Hot-Socketing

Because MAX 7000A devices can be used in a mixed-voltage environment, they have been designed specifically to tolerate any possible power-up sequence. The V_{CCIO} and V_{CCINT} power planes can be powered in any order.

Signals can be driven into MAX 7000AE devices before and during power-up (and power-down) without damaging the device. Additionally, MAX 7000AE devices do not drive out during power-up. Once operating conditions are reached, MAX 7000AE devices operate as specified by the user.

MAX 7000AE device I/O pins will not source or sink more than 300 µA of DC current during power-up. All pins can be driven up to 5.75 V during hot-socketing, except the OE1 and GLCRn pins. The OE1 and GLCRn pins can be driven up to 3.6 V during hot-socketing. After V_{CCINT} and V_{CCIO} reach the recommended operating conditions, these two pins are 5.0-V tolerant.

EPM7128A and EPM7256A devices do not support hot-socketing and may drive out during power-up.

Design Security

All MAX 7000A devices contain a programmable security bit that controls access to the data programmed into the device. When this bit is programmed, a design implemented in the device cannot be copied or retrieved. This feature provides a high level of design security because programmed data within EEPROM cells is invisible. The security bit that controls this function, as well as all other programmed data, is reset only when the device is reprogrammed.

Generic Testing

MAX 7000A devices are fully tested. Complete testing of each programmable EEPROM bit and all internal logic elements ensures 100% programming yield. AC test measurements are taken under conditions equivalent to those shown in Figure 9. Test patterns can be used and then erased during early stages of the production flow.

*Table 15. MAX 7000A Device DC Operating Conditions*   Note (6)

Symbol	Parameter	Conditions	Min	Max	Unit
V_{IH}	High-level input voltage		1.7	5.75	V
V_{IL}	Low-level input voltage		−0.5	0.8	V
V_{OH}	3.3-V high-level TTL output voltage	I_{OH} = −8 mA DC, V_{CCIO} = 3.00 V (7)	2.4		V
	3.3-V high-level CMOS output voltage	I_{OH} = −0.1 mA DC, V_{CCIO} = 3.00 V (7)	V_{CCIO} − 0.2		V
	2.5-V high-level output voltage	I_{OH} = −100 µA DC, V_{CCIO} = 2.30 V (7)	2.1		V
		I_{OH} = −1 mA DC, V_{CCIO} = 2.30 V (7)	2.0		V
		I_{OH} = −2 mA DC, V_{CCIO} = 2.30 V (7)	1.7		V
V_{OL}	3.3-V low-level TTL output voltage	I_{OL} = 8 mA DC, V_{CCIO} = 3.00 V (8)		0.45	V
	3.3-V low-level CMOS output voltage	I_{OL} = 0.1 mA DC, V_{CCIO} = 3.00 V (8)		0.2	V
	2.5-V low-level output voltage	I_{OL} = 100 µA DC, V_{CCIO} = 2.30 V (8)		0.2	V
		I_{OL} = 1 mA DC, V_{CCIO} = 2.30 V (8)		0.4	V
		I_{OL} = 2 mA DC, V_{CCIO} = 2.30 V (8)		0.7	V
I_I	Input leakage current	V_I = −0.5 to 5.5 V (9)	−10	10	µA
I_{OZ}	Tri-state output off-state current	V_I = −0.5 to 5.5 V (9)	−10	10	µA
R_{ISP}	Value of I/O pin pull-up resistor during in-system programming or during power-up	V_{CCIO} = 3.0 to 3.6 V (10)	20	50	kΩ
		V_{CCIO} = 2.3 to 2.7 V (10)	30	80	kΩ
		V_{CCIO} = 2.3 to 3.6 V (11)	20	74	kΩ

Table 16. MAX 7000A Device Capacitance   Note (12)

Symbol	Parameter	Conditions	Min	Max	Unit
C_{IN}	Input pin capacitance	V_{IN} = 0 V, f = 1.0 MHz		8	pF
$C_{I/O}$	I/O pin capacitance	V_{OUT} = 0 V, f = 1.0 MHz		8	pF

Figure 10 shows the typical output drive characteristics of MAX 7000A devices.

Figure 10. Output Drive Characteristics of MAX 7000A Devices
Timing Model

MAX 7000A device timing can be analyzed with the Altera software, a variety of popular industry-standard EDA simulators and timing analyzers, or with the timing model shown in Figure 11. MAX 7000A devices have predictable internal delays that enable the designer to determine the worst-case timing of any design. The software provides timing simulation, point-to-point delay prediction, and detailed timing analysis for device-wide performance evaluation.

Tables 17 through 30 show EPM7032AE, EPM7064AE, EPM7128AE, EPM7256AE, EPM7512AE, EPM7128A, and EPM7256A timing information.

t_{ACO1}	Array clock to output delay	C1 = 35 pF *(2)*	1.0	5.4	1.0	7.3	1.0	9.7	ns
t_{ACH}	Array clock high time		2.0		3.0		4.0		ns
t_{ACL}	Array clock low time		2.0		3.0		4.0		ns
t_{CPPW}	Minimum pulse width for clear and preset	*(3)*	2.0		3.0		4.0		ns
t_{CNT}	Minimum global clock period	*(2)*		5.8		7.9		10.5	ns
f_{CNT}	Maximum internal global clock frequency	*(2), (4)*	172.4		126.6		95.2		MHz
t_{ACNT}	Minimum array clock period	*(2)*		5.8		7.9		10.5	ns
f_{ACNT}	Maximum internal array clock frequency	*(2), (4)*	172.4		126.6		95.2		MHz

Table 24. EPM7256AE Internal Timing Parameters (Part 1 of 2)   Note (1)

Symbol	Parameter	Conditions	Speed Grade						Unit
			-5		-7		-10		
			Min	Max	Min	Max	Min	Max	
t_{IN}	Input pad and buffer delay			0.7		0.9		1.2	ns
t_{IO}	I/O input pad and buffer delay			0.7		0.9		1.2	ns
t_{FIN}	Fast input delay			2.4		2.9		3.4	ns
t_{SEXP}	Shared expander delay			2.1		2.8		3.7	ns
t_{PEXP}	Parallel expander delay			0.3		0.5		0.6	ns
t_{LAD}	Logic array delay			1.7		2.2		2.8	ns
t_{LAC}	Logic control array delay			0.8		1.0		1.3	ns
t_{IOE}	Internal output enable delay			0.0		0.0		0.0	ns
t_{OD1}	Output buffer and pad delay, slow slew rate = off V_{CCIO} = 3.3 V	C1 = 35 pF		0.9		1.2		1.6	ns
t_{OD2}	Output buffer and pad delay, slow slew rate = off V_{CCIO} = 2.5 V	C1 = 35 pF (5)		1.4		1.7		2.1	ns
t_{OD3}	Output buffer and pad delay, slow slew rate = on V_{CCIO} = 2.5 V or 3.3 V	C1 = 35 pF		5.9		6.2		6.6	ns
t_{ZX1}	Output buffer enable delay, slow slew rate = off V_{CCIO} = 3.3 V	C1 = 35 pF		4.0		4.0		5.0	ns
t_{ZX2}	Output buffer enable delay, slow slew rate = off V_{CCIO} = 2.5 V	C1 = 35 pF (5)		4.5		4.5		5.5	ns
t_{ZX3}	Output buffer enable delay, slow slew rate = on V_{CCIO} = 3.3 V	C1 = 35 pF		9.0		9.0		10.0	ns
t_{XZ}	Output buffer disable delay	C1 = 5 pF		4.0		4.0		5.0	ns
t_{SU}	Register setup time		1.5		2.1		2.9		ns
t_H	Register hold time		0.7		0.9		1.2		ns
t_{FSU}	Register setup time of fast input		1.1		1.6		1.6		ns
t_{FH}	Register hold time of fast input		1.4		1.4		1.4		ns
t_{RD}	Register delay			0.9		1.2		1.6	ns
t_{COMB}	Combinatorial delay			0.5		0.8		1.2	ns

Symbol	Parameter	Conditions	Speed Grade								Unit
			-6		-7		-10		-12		
			Min	Max	Min	Max	Min	Max	Min	Max	
t_{RD}	Register delay			1.7		2.1		2.8		3.3	ns
t_{COMB}	Combinatorial delay			1.7		2.1		2.8		3.3	ns
t_{IC}	Array clock delay			2.4		3.0		4.1		4.9	ns
t_{EN}	Register enable time			2.4		3.0		4.1		4.9	ns
t_{GLOB}	Global control delay			1.0		1.2		1.7		2.0	ns
t_{PRE}	Register preset time			3.1		3.9		5.2		6.2	ns
t_{CLR}	Register clear time			3.1		3.9		5.2		6.2	ns
t_{PIA}	PIA delay	(2)		0.9		1.1		1.5		1.8	ns
t_{LPA}	Low-power adder	(6)		11.0		10.0		10.0		10.0	ns

Table 28. EPM7128A Internal Timing Parameters (Part 2 of 2)   *Note (1)*

The parameters in this equation are:

MC_{TON}	=	Number of macrocells with the Turbo Bit option turned on, as reported in the MAX+PLUS II Report File (**.rpt**)
MC_{DEV}	=	Number of macrocells in the device
MC_{USED}	=	Total number of macrocells in the design, as reported in the Report File
f_{MAX}	=	Highest clock frequency to the device
tog_{LC}	=	Average percentage of logic cells toggling at each clock (typically 12.5%)
A, B, C	=	Constants, shown in Table 31

Table 31. MAX 7000A I_{CC} Equation Constants

| Device	A	B	C
EPM7032AE	0.71	0.30	0.014
EPM7064AE	0.71	0.30	0.014
EPM7128A	0.71	0.30	0.014
EPM7128AE	0.71	0.30	0.014
EPM7256A	0.71	0.30	0.014
EPM7256AE	0.71	0.30	0.014
EPM7512AE	0.71	0.30	0.014

This calculation provides an I_{CC} estimate based on typical conditions using a pattern of a 16-bit, loadable, enabled, up/down counter in each LAB with no output load. Actual I_{CC} should be verified during operation because this measurement is sensitive to the actual pattern in the device and the environmental operating conditions.
