What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

      b. 10 µf near for each power supply source
      c. For VDD_LV, 0.1uf close to each VDD/VSS pin pair is required. Depending on the the selected regulation mode, this amount of capacitance will need to be subtracted from the total capacitance required by the regulator for e.g., as specified by CFP_REG parameter.
   2. For VDD_LV, 0.1uf close to each VDD/VSS pin pair is required. Depending on the the selected regulation mode, this amount of capacitance will need to be subtracted from the total capacitance required by the regulator for e.g., as specified by CFP_REG parameter
6. Only applicable to ADC1
7. In external ballast configuration the following must be ensured during power-up and power-down (Note: If $V_{DD\_HV\_BALLAST}$ is supplied from the same source as VDD_HV_A this condition is implicitly met):
   - During power-up, $V_{DD\_HV\_BALLAST}$ must have met the min spec of 2.25V before VDD_HV_A reaches the POR_HV_RISE min of 2.75V.
   - During power-down, $V_{DD\_HV\_BALLAST}$ must not drop below the min spec of 2.25V until VDD_HV_A is below POR_HV_FALL min of 2.7V.

NOTE

For a typical configuration using an external ballast transistor with separate supply for VDD_HV_A and the ballast collector, a bulk storage capacitor (as defined in Table 8) is required on VDD_HV_A close to the device pins to ensure a stable supply voltage.

Extra care must be taken if the VDD_HV_A supply is also being used to power the external ballast transistor or the device is running in internal regulation mode. In these modes, the inrush current on device Power Up or on exit from Low Power Modes is significant and may case the VDD_HV_A voltage to drop resulting in an LVD reset event. To avoid this, the board layout should be optimized to reduce common trace resistance or additional capacitance at the ballast transistor collector (or VDD_HV_A pins in the case of internal regulation mode) is required. NXP recommends that customers simulate the external voltage supply circuitry.

In all circumstances, the voltage on VDD_HV_A must be maintained within the specified operating range (see Recommended operating conditions) to prevent LVD events.

4.6 Electrostatic discharge (ESD) characteristics

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n + 1) supply pin). This test conforms to the AEC-Q100-002/-003/-011 standard.

NOTE

A device will be defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements. Complete DC parametric and functional testing shall be performed per applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

6.2 Clocks and PLL interfaces modules

6.2.1 Main oscillator electrical characteristics

This device provides a driver for oscillator in pierce configuration with amplitude control. Controlling the amplitude allows a more sinusoidal oscillation, reducing in this way the EMI. Other benefits arises by reducing the power consumption. This Loop Controlled Pierce (LCP mode) requires good practices to reduce the stray capacitance of traces between crystal and MCU.

An operation in Full Swing Pierce (FSP mode), implemented by an inverter is also available in case of parasitic capacitances and cannot be reduced by using crystal with high equivalent series resistance. For this mode, a special care needs to be taken regarding the serial resistance used to avoid the crystal overdrive.

Other two modes called External (EXT Wave) and disable (OFF mode) are provided. For EXT Wave, the drive is disabled and an external source of clock within CMOS level based in analog oscillator supply can be used. When OFF, EXTAL is pulled down by 240 Kohms resistor and the feedback resistor remains active connecting XTAL through EXTAL by 1M resistor.

10 Reset sequence

10.1 Reset sequence

This section describes different reset sequences and details the duration for which the device remains in reset condition in each of those conditions.

10.1.1 Reset sequence duration

Table 49 specifies the reset sequence duration for the five different reset sequences described in Reset sequence description.

Table 49. RESET sequences

10.1.2 BAF execution duration

Following table specifies the typical BAF execution time in case BAF boot header is present at first location (Typical) and last location (worst case). Total Boot time is the sum of reset sequence duration and BAF execution time.

Table 50. BAF execution duration

BAF execution duration	Min	Typ	Max	Unit

10.1.3 Reset sequence description

The figures in this section show the internal states of the device during the five different reset sequences. The dotted lines in the figures indicate the starting point and the end point for which the duration is specified in .

With the beginning of DRUN mode, the first instruction is fetched and executed. At this point, application execution starts and the internal reset sequence is finished.

The following figures show the internal states of the device during the execution of the reset sequence and the possible states of the RESET_B signal pin.

NOTE

RESET_B is a bidirectional pin. The voltage level on this pin can either be driven low by an external reset generator or by the device internal reset circuitry. A high level on this pin can only be generated by an external pullup resistor which is strong enough to overdrive the weak internal pulldown resistor. The rising edge on RESET_B in the following figures indicates the time when the device stops driving it low. The reset sequence durations given in are applicable only if the internal reset sequence is not prolonged by an external reset generator keeping RESET_B asserted low beyond the last Phase3.

		  • Updated footnote for $V_{DD\_HV\_ADC1\_REF}$.
		  • Added footnote to 'Conditions', All voltages are referred to V_{SS_HV} unless otherwise specified
		  • Removed footnote from 'Max', Absolute maximum voltages are currently maximum burn-in voltages. Absolute maximum specifications for device stress have not yet been determined.
		• In section: Recommended operating conditions
		  • Added opening text: "The following table describes the operating conditions ... "
		  • Added note: "$V_{DD\_HV\_A}$, $V_{DD\_HV\_B}$ and $V_{DD\_HV\_C}$ are all ... "
		  • In table: Recommended operating conditions (VDD_HV_x = 3.3 V) and (VDD_HV_x = 5 V)
		  • Added footnote to 'Conditions' cloumn, (All voltages are referred to V_{SS_HV} unless otherwise specified).
		  • Updated footnote for 'Min' column to Device will be functional down (and electrical specifications as per various datasheet parameters will be guaranteed) to the point where one of the LVD/HVD resets the device. When voltage drops outside range for an LVD/HVD, device is reset.
		  • Removed footnote for '$V_{DD\_HV\_A}$', '$V_{DD\_HV\_B}$', and '$V_{DD\_HV\_C}$' entry and updated the parameter column.
		  • Removed entry : 'V_{SS_HV}'
		  • Updated 'Parameter' column for '$V_{DD\_HV\_FLA}$', '$V_{DD\_HV\_ADC1\_REF}$', 'V_{DD_LV}'

		  • Updated 'Parameter' 'Min' 'Max' columns for '$V_{SS\_HV\_ADC0}$' and '$V_{SS\_HV\_ADC1}$'
		  • Updated footnote for 'V_{DD_LV} ' to V_{DD_LV} supply pins should never be grounded (through a small impedance). If these are not driven, they should only be left floating.
		  • Removed row for symbol 'V_{SS_LV}'
		  • Removed footnote from 'Max' column of '$V_{DD\_HV\_ADC0}$' and '$V_{DD\_HV\_ADC1}$', (PA3, PA7, PA10, PA11 and PE12 ADC_1 channels are coming from $V_{DD\_HV\_B}$ domain hence $V_{DD\_HV\_ADC1}$ should be within ±100 mV of $V_{DD\_HV\_B}$ when these channels are used for ADC_1).
		  • In table: Recommended operating conditions ($V_{DD\_HV\_x}$ = 3.3 V)
		  • Removed footnote from '$V_{IN1\_CMP\_REF}$', (Only applicable when supplying from external source).
		  • In table: Recommended operating conditions ($V_{DD\_HV\_x}$ = 5 V)
		  • Added spec for '$V_{IN1\_CMP\_REF}$' and corresponding footnotes.
