What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	e200z4
Core Size	32-Bit Single-Core
Speed	120MHz
Connectivity	CANbus, Ethernet, FlexRay, I²C, LINbus, SPI
Peripherals	DMA, I²S, POR, WDT
Number of I/O	-
Program Memory Size	2MB (2M x 8)
Program Memory Type	FLASH
EEPROM Size	64K x 8
RAM Size	256K x 8
Voltage - Supply (Vcc/Vdd)	3.15V ~ 5.5V
Data Converters	A/D 36x10b, 16x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	100-LFBGA
Supplier Device Package	100-MAPBGA (11x11)

1. Feature set dependent on selected peripheral multiplexing, table shows example. Peripheral availability is package dependent.
2. Based on 125°C ambient operating temperature and subject to full device characterization.
3. Contact NXP representative for part number
4. Additional SWT included when HSM option selected
5. See device datasheet and reference manual for information on to timer channel configuration and functions.
6. Estimated I/O count for largest proposed packages based on multiplexing with peripherals.

4.2 Recommended operating conditions

The following table describes the operating conditions for the device, and for which all specifications in the data sheet are valid, except where explicitly noted. The device operating conditions must not be exceeded in order to guarantee proper operation and reliability. The ranges in this table are design targets and actual data may vary in the given range.

NOTE

- For normal device operations, all supplies must be within operating range corresponding to the range mentioned in following tables. This is required even if some of the features are not used.
- If VDD_HV_A is in 3.3V range, VDD_HV_FLA should be externally supplied using a 3.3V source. If VDD_HV_A is in 3.3V range, VDD_HV_FLA should be shorted to VDD_HV_A.
- VDD_HV_A, VDD_HV_B and VDD_HV_C are all independent supplies and can each be set to 3.3V or 5V. The following tables: 'Recommended operating conditions (VDD_HV_x = 3.3 V)' and table 'Recommended operating conditions (VDD_HV_x = 5 V)' specify their ranges when configured in 3.3V or 5V respectively.

Table 6. Recommended operating conditions ($V_{DD\_HV\_x}$ = 3.3 V)

Symbol	Parameter	Conditions[1]	Min[2]	Max	Unit
$V_{DD\_HV\_A}$ $V_{DD\_HV\_B}$ $V_{DD\_HV\_C}$	HV IO supply voltage	—	3.15	3.6	V
$V_{DD\_HV\_FLA}$[3]	HV flash supply voltage	—	3.15	3.6	V
$V_{DD\_HV\_ADC1\_REF}$	HV ADC1 high reference voltage	—	3.0	5.5	V
$V_{DD\_HV\_ADC0}$ $V_{DD\_HV\_ADC1}$	HV ADC supply voltage	—	max(VDD_HV_A,VDD_HV_B,VDD_HV_C) - 0.05	3.6	V
$V_{SS\_HV\_ADC0}$ $V_{SS\_HV\_ADC1}$	HV ADC supply ground	—	-0.1	0.1	V
V_{DD_LV}[4, 5]	Core supply voltage	—	1.2	1.32	V
$V_{IN1\_CMP\_REF}$[6, 7]	Analog Comparator DAC reference voltage	—	3.15	3.6	V

5. 1. For VDD_HV_x, 1µf on each side of the chip
      a. 0.1 µf close to each VDD/VSS pin pair.
      b. 10 µf near for each power supply source
      c. For VDD_LV, 0.1uf close to each VDD/VSS pin pair is required. Depending on the the selected regulation mode, this amount of capacitance will need to be subtracted from the total capacitance required by the regulator for e.g., as specified by CFP_REG parameter.
   2. For VDD_LV, 0.1uf close to each VDD/VSS pin pair is required. Depending on the the selected regulation mode, this amount of capacitance will need to be subtracted from the total capacitance required by the regulator for e.g., as specified by CFP_REG parameter
6. Only applicable to ADC1
7. In external ballast configuration the following must be ensured during power-up and power-down (Note: If $V_{DD\_HV\_BALLAST}$ is supplied from the same source as VDD_HV_A this condition is implicitly met):
   - During power-up, $V_{DD\_HV\_BALLAST}$ must have met the min spec of 2.25V before VDD_HV_A reaches the POR_HV_RISE min of 2.75V.
   - During power-down, $V_{DD\_HV\_BALLAST}$ must not drop below the min spec of 2.25V until VDD_HV_A is below POR_HV_FALL min of 2.7V.

NOTE

For a typical configuration using an external ballast transistor with separate supply for VDD_HV_A and the ballast collector, a bulk storage capacitor (as defined in Table 8) is required on VDD_HV_A close to the device pins to ensure a stable supply voltage.

Extra care must be taken if the VDD_HV_A supply is also being used to power the external ballast transistor or the device is running in internal regulation mode. In these modes, the inrush current on device Power Up or on exit from Low Power Modes is significant and may case the VDD_HV_A voltage to drop resulting in an LVD reset event. To avoid this, the board layout should be optimized to reduce common trace resistance or additional capacitance at the ballast transistor collector (or VDD_HV_A pins in the case of internal regulation mode) is required. NXP recommends that customers simulate the external voltage supply circuitry.

In all circumstances, the voltage on VDD_HV_A must be maintained within the specified operating range (see Recommended operating conditions) to prevent LVD events.

Table 18. Functional reset pad electrical specifications (continued)

	Max positive/negative injection		–5	—	5	mA
	Max leakage (standard channel)	105 °C T_A	—	5	250	nA
$TUE_{standard/extended\ channels}$	Total unadjusted error for standard channels	Without current injection	–4	+/-3	4	LSB
		With current injection[6]		+/-4		LSB
$t_{recovery}$	STOP mode to Run mode recovery time				< 1	µs

1. Active ADC Input, VinA < [min(ADC_ADV, IO_Supply_A,B,C)]. Violation of this condition would lead to degradation of ADC performance. Please refer to Table: 'Absolute maximum ratings' to avoid damage. Refer to Table: 'Recommended operating conditions' for required relation between IO_supply_A, B, C and ADC_Supply.
2. The internally generated clock (known as AD_clk or ADCK) could be same as the peripheral clock or half of the peripheral clock based on register configuration in the ADC.
3. During the sample time the input capacitance C_S can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_{sample}. After the end of the sample time t_{sample}, changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_{sample} depend on programming.
4. This parameter does not include the sample time t_{sample}, but only the time for determining the digital result and the time to load the result register with the conversion result.
5. See Figure 65
6. Current injection condition for ADC channels is defined for an inactive ADC channel (on which conversion is NOT being performed), and this occurs when voltage on the ADC pin exceeds the I/O supply or ground. However, absolute maximum voltage spec on pad input (VINA, see Table: Absolute maximum ratings) must be honored to meet TUE spec quoted here

Table 31. Flash memory Array Integrity and Margin Read specifications (continued)

Symbol	Characteristic	Min	Typical	Max[1, 1]	Units[2, 2]
$t_{ai256kseq}$	Array Integrity time for sequential sequence on 256 KB block.	—	—	8192 x Tperiod x Nread	—
$t_{mr16kseq}$	Margin Read time for sequential sequence on 16 KB block.	73.81	—	110.7	µs
$t_{mr32kseq}$	Margin Read time for sequential sequence on 32 KB block.	128.43	—	192.6	µs
$t_{mr64kseq}$	Margin Read time for sequential sequence on 64 KB block.	237.65	—	356.5	µs
$t_{mr256kseq}$	Margin Read time for sequential sequence on 256 KB block.	893.01	—	1,339.5	µs

1. Array Integrity times need to be calculated and is dependent on system frequency and number of clocks per read. The equation presented require Tperiod (which is the unit accurate period, thus for 200 MHz, Tperiod would equal 5e-9) and Nread (which is the number of clocks required for read, including pipeline contribution. Thus for a read setup that requires 6 clocks to read with no pipeline, Nread would equal 6. For a read setup that requires 6 clocks to read, and has the address pipeline set to 2, Nread would equal 4 (or 6 - 2).)
2. The units for Array Integrity are determined by the period of the system clock. If unit accurate period is used in the equation, the results of the equation are also unit accurate.

6.3.3 Flash memory module life specifications

Table 32. Flash memory module life specifications

Symbol	Characteristic	Conditions	Min	Typical	Units
Array P/E cycles	Number of program/erase cycles per block for 16 KB, 32 KB and 64 KB blocks.[1, 1]	—	250,000	—	P/E cycles
	Number of program/erase cycles per block for 256 KB blocks.[2, 2]	—	1,000	250,000	P/E cycles
Data retention	Minimum data retention.	Blocks with 0 - 1,000 P/E cycles.	50	—	Years
		Blocks with 100,000 P/E cycles.	20	—	Years
		Blocks with 250,000 P/E cycles.	10	—	Years

1. Program and erase supported across standard temperature specs.
2. Program and erase supported across standard temperature specs.

6.3.4 Data retention vs program/erase cycles

Graphically, Data Retention versus Program/Erase Cycles can be represented by the following figure. The spec window represents qualified limits. The extrapolated dotted line demonstrates technology capability, however is beyond the qualification limits.

			Master (MTFE = 1, CPHA = 1)	–2	—	–2	—	

1. SMPL_PTR should be set to 1

NOTE

Restriction For High Speed modes

- DSPI2, DSPI3, SPI1 and SPI2 will support 40MHz Master mode SCK
- DSPI2, DSPI3, SPI1 and SPI2 will support 25MHz Slave SCK frequency
- Only one {SIN,SOUT and SCK} group per DSPI/SPI will support high frequency mode
- For Master mode MTFE will be 1 for high speed mode
- For high speed slaves, their master have to be in MTFE=1 mode or should be able to support 15ns tSUO delay

NOTE

For numbers shown in the following figures, see Table 35

10 Reset sequence

10.1 Reset sequence

This section describes different reset sequences and details the duration for which the device remains in reset condition in each of those conditions.

10.1.1 Reset sequence duration

Table 49 specifies the reset sequence duration for the five different reset sequences described in Reset sequence description.

Table 49. RESET sequences

No.	Symbol	Parameter	T_{Reset}			Unit
			Min	Typ [1, 1]	Max	
1	T_{DRB}	Destructive Reset Sequence, BIST enabled	6.2	7.3	-	ms
2	T_{DR}	Destructive Reset Sequence, BIST disabled	110	182	-	us
3	T_{ERLB}	External Reset Sequence Long, Unsecure Boot	6.2	7.3	-	ms
4	T_{FRL}	Functional Reset Sequence Long, Unsecure Boot	110	182	-	us
5	T_{FRS}	Functional Reset Sequence Short, Unsecure Boot	7	9	-	us

1. The Typ value is applicable only if the reset sequence duration is not prolonged by an extended assertion of RESET_B by an external reset generator.

10.1.2 BAF execution duration

Following table specifies the typical BAF execution time in case BAF boot header is present at first location (Typical) and last location (worst case). Total Boot time is the sum of reset sequence duration and BAF execution time.

Table 50. BAF execution duration

BAF execution duration	Min	Typ	Max	Unit
BAF execution time (boot header at first location)	—	200	—	µs
BAF execution time (boot header at last location)	—	—	320	µs

10.1.3 Reset sequence description

The figures in this section show the internal states of the device during the five different reset sequences. The dotted lines in the figures indicate the starting point and the end point for which the duration is specified in .

With the beginning of DRUN mode, the first instruction is fetched and executed. At this point, application execution starts and the internal reset sequence is finished.

The following figures show the internal states of the device during the execution of the reset sequence and the possible states of the RESET_B signal pin.

NOTE

RESET_B is a bidirectional pin. The voltage level on this pin can either be driven low by an external reset generator or by the device internal reset circuitry. A high level on this pin can only be generated by an external pullup resistor which is strong enough to overdrive the weak internal pulldown resistor. The rising edge on RESET_B in the following figures indicates the time when the device stops driving it low. The reset sequence durations given in are applicable only if the internal reset sequence is not prolonged by an external reset generator keeping RESET_B asserted low beyond the last Phase3.

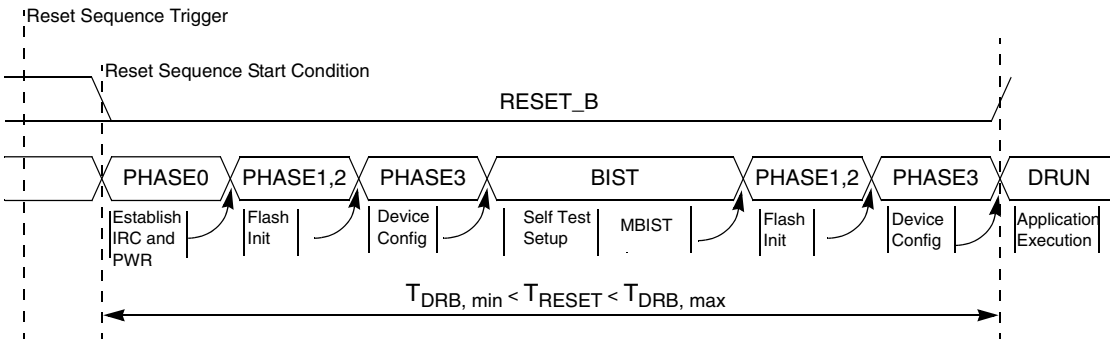

Figure 32. Destructive reset sequence, BIST enabled

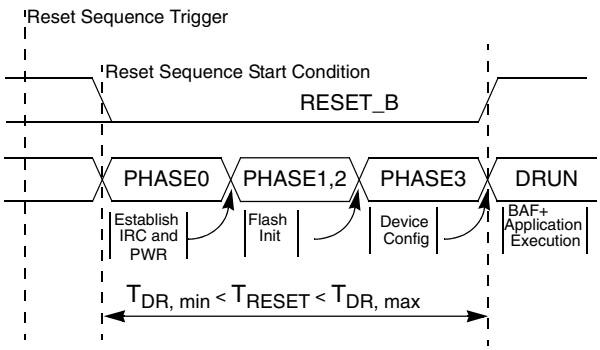

Figure 33. Destructive reset sequence, BIST disabled

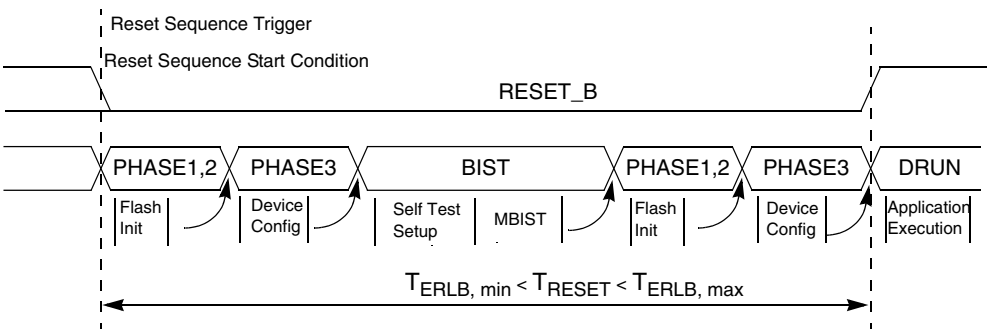

Figure 34. External reset sequence long, BIST enabled

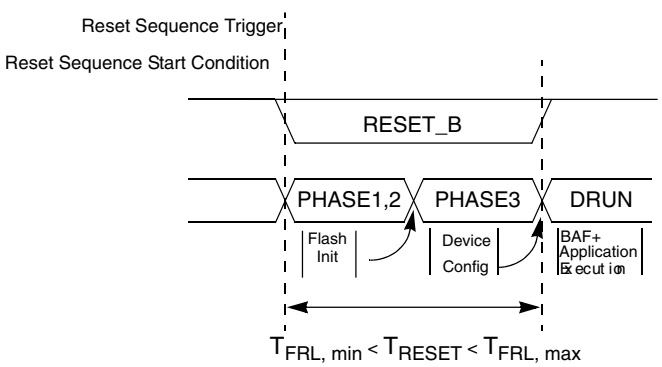

Figure 35. Functional reset sequence long

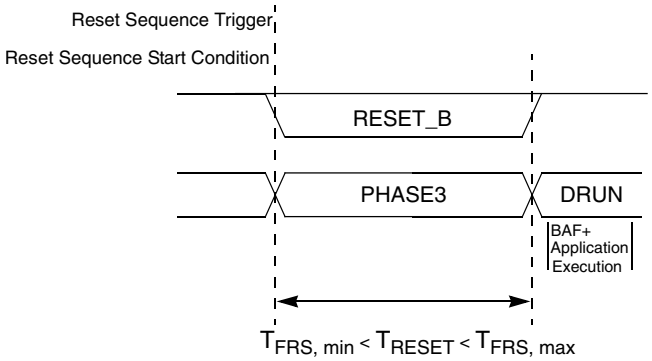

Figure 36. Functional reset sequence short

The reset sequences shown in Figure 35 and Figure 36 are triggered by functional reset events. RESET_B is driven low during these two reset sequences only if the corresponding functional reset source (which triggered the reset sequence) was enabled to drive RESET_B low for the duration of the internal reset sequence. See the RGM_FBRE register in the device reference manual for more information.
