What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

4.3 Voltage regulator electrical characteristics

The voltage regulator is composed of the following blocks:

- Choice of generating supply voltage for the core area.
    - Control of external NPN ballast transistor
    - Generating core supply using internal ballast transistor
    - Connecting an external 1.25 V (nominal) supply directly without the NPN ballast
- Internal generation of the 3.3 V flash supply when device connected in 5V applications
- External bypass of the 3.3 V flash regulator when device connected in 3.3V applications
- Low voltage detector - low threshold (LVD_IO_A_LO) for $V_{DD\_HV\_IO\_A\ supply}$
- Low voltage detector - high threshold (LVD_IO_A_Hi) for $V_{DD\_HV\_IO\_A\ supply}$
- Low voltage detector (LVD_FLASH) for 3.3 V flash supply (VDD_HV_FLA)
- Various low voltage detectors (LVD_LV_x)
- High voltage detector (HVD_LV_cold) for 1.2 V digital core supply (VDD_LV)

1. All monitors that are active at power-up will gate the power up recovery and prevent exit from POWERUP phase until the minimum level is crossed. These monitors can in some cases be masked during normal device operation, but when active will always generate a destructive reset.
2. Voltage monitors marked as non maskable are essential for device operation and hence cannot be masked.
3. There is no voltage monitoring on the $V_{DD\_HV\_ADC0}$, $V_{DD\_HV\_ADC1}$, $V_{DD\_HV\_B}$ and $V_{DD\_HV\_C}$ I/O segments. For applications requiring monitoring of these segments, either connect these to $V_{DD\_HV\_A}$ at the PCB level or monitor externally.

Table 45. JTAG pin AC electrical characteristics [1] (continued)

#	Symbol	Characteristic	Min	Max	Unit
12	t_{BSDVZ}	TCK Falling Edge to Output Valid out of High Impedance	—	600	ns
13	t_{BSDHZ}	TCK Falling Edge to Output High Impedance	—	600	ns
14	t_{BSDST}	Boundary Scan Input Valid to TCK Rising Edge	15	—	ns
15	t_{BSDHT}	TCK Rising Edge to Boundary Scan Input Invalid	15	—	ns

1. These specifications apply to JTAG boundary scan only.
2. This timing applies to TDI, TDO, TMS pins, however, actual frequency is limited by pad type for EXTEST instructions. Refer to pad specification for allowed transition frequency
3. Timing includes TCK pad delay, clock tree delay, logic delay and TDO output pad delay.
4. Applies to all pins, limited by pad slew rate. Refer to IO delay and transition specification and add 20 ns for JTAG delay.

6.5.4 External interrupt timing (IRQ pin)

Table 48. External interrupt timing specifications

No.	Symbol	Parameter	Conditions	Min	Max	Unit
1	t_{IPWL}	IRQ pulse width low	—	3	—	t_{CYC}
2	t_{IPWH}	IRQ pulse width high	—	3	—	t_{CYC}
3	t_{ICYC}	IRQ edge to edge time	—	6	—	t_{CYC}

These values applies when IRQ pins are configured for rising edge or falling edge events, but not both.

10 Reset sequence

10.1 Reset sequence

This section describes different reset sequences and details the duration for which the device remains in reset condition in each of those conditions.

10.1.1 Reset sequence duration

Table 49 specifies the reset sequence duration for the five different reset sequences described in Reset sequence description.

Table 49. RESET sequences

No.	Symbol	Parameter	T_{Reset}			Unit
			Min	Typ [1, 1]	Max	
1	T_{DRB}	Destructive Reset Sequence, BIST enabled	6.2	7.3	-	ms
2	T_{DR}	Destructive Reset Sequence, BIST disabled	110	182	-	us
3	T_{ERLB}	External Reset Sequence Long, Unsecure Boot	6.2	7.3	-	ms
4	T_{FRL}	Functional Reset Sequence Long, Unsecure Boot	110	182	-	us
5	T_{FRS}	Functional Reset Sequence Short, Unsecure Boot	7	9	-	us

1. The Typ value is applicable only if the reset sequence duration is not prolonged by an extended assertion of RESET_B by an external reset generator.
