What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	e200z4
Core Size	32-Bit Single-Core
Speed	120MHz
Connectivity	CANbus, Ethernet, FlexRay, I²C, LINbus, SPI
Peripherals	DMA, I²S, POR, WDT
Number of I/O	129
Program Memory Size	3MB (3M x 8)
Program Memory Type	FLASH
EEPROM Size	64K x 8
RAM Size	384K x 8
Voltage - Supply (Vcc/Vdd)	3.15V ~ 5.5V
Data Converters	A/D 36x10b, 16x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	176-LQFP Exposed Pad
Supplier Device Package	176-LQFP (24x24)

2 Family comparison

The following table provides a summary of the different members of the MPC5746C family and their proposed features. This information is intended to provide an understanding of the range of functionality offered by this family. For full details of all of the family derivatives please contact your marketing representative.

NOTE

All optional features (Flash memory, RAM, Peripherals) start with lowest number or address (e.g., FlexCAN0) and end at highest available number or address (e.g., MPC574xB/C have 6 CAN, ending with FlexCAN5).

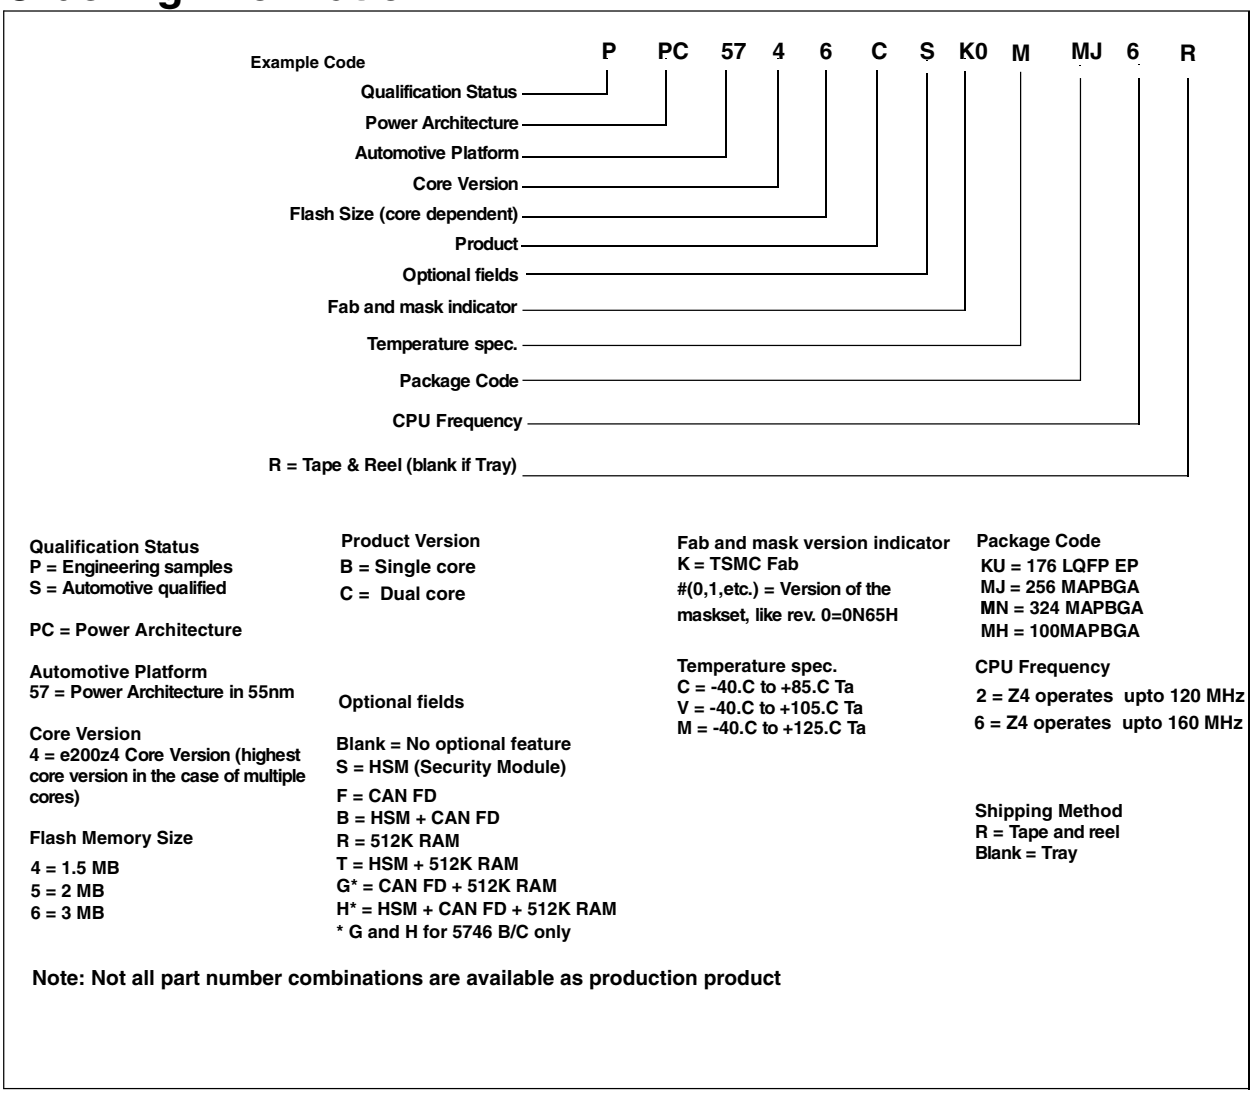
3.2 Ordering Information



Note: Not all part number combinations are available as production product

4 General

4.1 Absolute maximum ratings

NOTE

Functional operating conditions appear in the DC electrical characteristics. Absolute maximum ratings are stress ratings only, and functional operation at the maximum values is not guaranteed. See footnotes in Table 5 for specific conditions

4. VDD_LV supply pins should never be grounded (through a small impedance). If these are not driven, they should only be left floating
5. VIN1_CMP_REF ≤ VDD_HV_A
6. This supply is shorted VDD_HV_A on lower packages.
7. T_J=150°C. Assumes T_A=125°C
    - Assumes maximum θJA of 2s2p board. See Thermal attributes

4.3 Voltage regulator electrical characteristics

The voltage regulator is composed of the following blocks:

- Choice of generating supply voltage for the core area.
    - Control of external NPN ballast transistor
    - Generating core supply using internal ballast transistor
    - Connecting an external 1.25 V (nominal) supply directly without the NPN ballast
- Internal generation of the 3.3 V flash supply when device connected in 5V applications
- External bypass of the 3.3 V flash regulator when device connected in 3.3V applications
- Low voltage detector - low threshold (LVD_IO_A_LO) for $V_{DD\_HV\_IO\_A\ supply}$
- Low voltage detector - high threshold (LVD_IO_A_Hi) for $V_{DD\_HV\_IO\_A\ supply}$
- Low voltage detector (LVD_FLASH) for 3.3 V flash supply (VDD_HV_FLA)
- Various low voltage detectors (LVD_LV_x)
- High voltage detector (HVD_LV_cold) for 1.2 V digital core supply (VDD_LV)
- Power on Reset (POR_LV) for 1.25 V digital core supply (VDD_LV)
- Power on Reset (POR_HV) for 3.3 V to 5 V supply (VDD_HV_A)

The following bipolar transistors[1] are supported, depending on the device performance requirements. As a minimum the following must be considered when determining the most appropriate solution to maintain the device under its maximum power dissipation capability: current, ambient temperature, mounting pad area, duty cycle and frequency for Idd, collector voltage, etc

1. BCP56, MCP68 and MJD31are guaranteed ballasts.

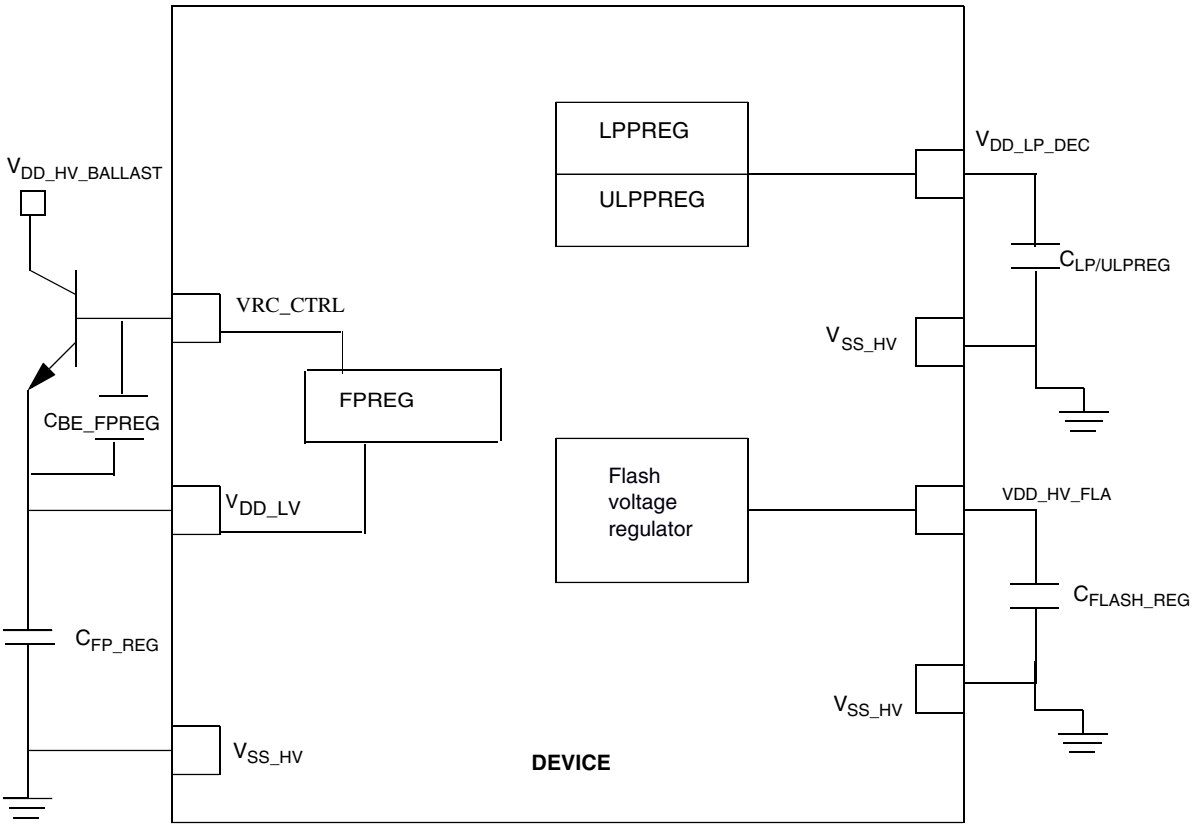


Figure 2. Voltage regulator capacitance connection

NOTE

On BGA, VSS_LV and VSS_HV have been joined on substrate and renamed as VSS.

5. 1. For VDD_HV_x, 1µf on each side of the chip
      a. 0.1 µf close to each VDD/VSS pin pair.
      b. 10 µf near for each power supply source
      c. For VDD_LV, 0.1uf close to each VDD/VSS pin pair is required. Depending on the the selected regulation mode, this amount of capacitance will need to be subtracted from the total capacitance required by the regulator for e.g., as specified by CFP_REG parameter.
   2. For VDD_LV, 0.1uf close to each VDD/VSS pin pair is required. Depending on the the selected regulation mode, this amount of capacitance will need to be subtracted from the total capacitance required by the regulator for e.g., as specified by CFP_REG parameter
6. Only applicable to ADC1
7. In external ballast configuration the following must be ensured during power-up and power-down (Note: If $V_{DD\_HV\_BALLAST}$ is supplied from the same source as VDD_HV_A this condition is implicitly met):
   - During power-up, $V_{DD\_HV\_BALLAST}$ must have met the min spec of 2.25V before VDD_HV_A reaches the POR_HV_RISE min of 2.75V.
   - During power-down, $V_{DD\_HV\_BALLAST}$ must not drop below the min spec of 2.25V until VDD_HV_A is below POR_HV_FALL min of 2.7V.

NOTE

For a typical configuration using an external ballast transistor with separate supply for VDD_HV_A and the ballast collector, a bulk storage capacitor (as defined in Table 8) is required on VDD_HV_A close to the device pins to ensure a stable supply voltage.

Extra care must be taken if the VDD_HV_A supply is also being used to power the external ballast transistor or the device is running in internal regulation mode. In these modes, the inrush current on device Power Up or on exit from Low Power Modes is significant and may case the VDD_HV_A voltage to drop resulting in an LVD reset event. To avoid this, the board layout should be optimized to reduce common trace resistance or additional capacitance at the ballast transistor collector (or VDD_HV_A pins in the case of internal regulation mode) is required. NXP recommends that customers simulate the external voltage supply circuitry.

In all circumstances, the voltage on VDD_HV_A must be maintained within the specified operating range (see Recommended operating conditions) to prevent LVD events.

1. Active ADC Input, VinA < [min(ADC_ADV, IO_Supply_A,B,C)]. Violation of this condition would lead to degradation of ADC performance. Please refer to Table: 'Absolute maximum ratings' to avoid damage. Refer to Table: 'Recommended operating conditions' for required relation between IO_supply_A, B, C and ADC_Supply.
2. The internally generated clock (known as AD_clk or ADCK) could be same as the peripheral clock or half of the peripheral clock based on register configuration in the ADC.
3. During the sample time the input capacitance C_S can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_{sample}. After the end of the sample time t_{sample}, changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_{sample} depend on programming.
4. This parameter does not include the sample time t_{sample}, but only the time for determining the digital result and the time to load the result register with the conversion result.
5. See Figure 65
6. Current injection condition for ADC channels is defined for an inactive ADC channel (on which conversion is NOT being performed), and this occurs when voltage on the ADC pin exceeds the I/O supply or ground. However, absolute maximum voltage spec on pad input (VINA, see Table: Absolute maximum ratings) must be honored to meet TUE spec quoted here

6.2 Clocks and PLL interfaces modules

6.2.1 Main oscillator electrical characteristics

This device provides a driver for oscillator in pierce configuration with amplitude control. Controlling the amplitude allows a more sinusoidal oscillation, reducing in this way the EMI. Other benefits arises by reducing the power consumption. This Loop Controlled Pierce (LCP mode) requires good practices to reduce the stray capacitance of traces between crystal and MCU.

An operation in Full Swing Pierce (FSP mode), implemented by an inverter is also available in case of parasitic capacitances and cannot be reduced by using crystal with high equivalent series resistance. For this mode, a special care needs to be taken regarding the serial resistance used to avoid the crystal overdrive.

Other two modes called External (EXT Wave) and disable (OFF mode) are provided. For EXT Wave, the drive is disabled and an external source of clock within CMOS level based in analog oscillator supply can be used. When OFF, EXTAL is pulled down by 240 Kohms resistor and the feedback resistor remains active connecting XTAL through EXTAL by 1M resistor.

Thermal attributes

Board type	Symbol	Description	256 MAPBGA	Unit	Notes
—	$R_{\theta JC}$	Thermal resistance, junction to case	7.9	°C/W	55
—	Ψ_{JT}	Thermal characterization parameter, junction to package top outside center (natural convection)	0.2	°C/W	66
—	$R_{\theta JB\_CSB}$	Thermal characterization parameter, junction to package bottom outside center (natural convection)	9.0	°C/W	77

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per SEMI G38-87 and JEDEC JESD51-2 with the single layer board horizontal.
3. Per JEDEC JESD51-6 with the board horizontal
4. Thermal resistance between the die and the printed circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.
7. Thermal characterization parameter indicating the temperature difference between package bottom center and the junction temperature per JEDEC JESD51-12. When Greek letters are not available, the thermal characterization parameter is written as Psi-JB.

Board type	Symbol	Description	100 MAPBGA	Unit	Notes
Single-layer (1s)	$R_{\theta JA}$	Thermal resistance, junction to ambient (natural convection)	50.9	°C/W	1, 21,2
Four-layer (2s2p)	$R_{\theta JA}$	Thermal resistance, junction to ambient (natural convection)	27.0	°C/W	1,2,33
Single-layer (1s)	$R_{\theta JMA}$	Thermal resistance, junction to ambient (200 ft./ min. air speed)	38.0	°C/W	1,3
Four-layer (2s2p)	$R_{\theta JMA}$	Thermal resistance, junction to ambient (200 ft./ min. air speed)	22.2	°C/W	1,3

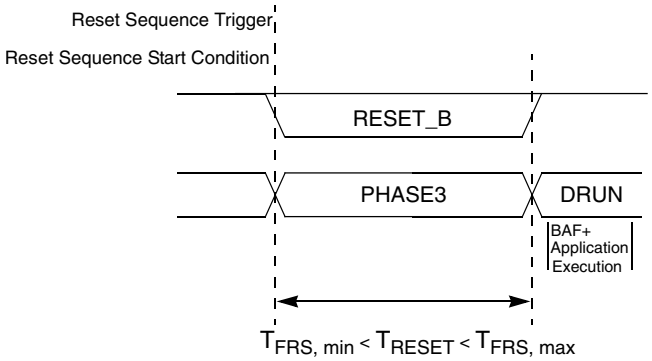

Figure 36. Functional reset sequence short

The reset sequences shown in Figure 35 and Figure 36 are triggered by functional reset events. RESET_B is driven low during these two reset sequences only if the corresponding functional reset source (which triggered the reset sequence) was enabled to drive RESET_B low for the duration of the internal reset sequence. See the RGM_FBRE register in the device reference manual for more information.

11 Revision History

11.1 Revision History

The following table provides a revision history for this document.

Table 51. Revision History

Rev. No.	Date	Substantial Changes
Rev 1	14 March 2013	Initial Release

Table 51. Revision History (continued)

Rev. No.	Date	Substantial Changes

		• In section, Thermal attributes
		  • Added table for 100 MAPBGA
		
		• In section Obtaining package dimensions
		  • Updated package details for 100 MAPBGA

		• Editoral updates throughtout including correction of various module names.

Table 51. Revision History (continued)

Rev. No.	Date	Substantial Changes

Rev 3	2 March 2016	• In section, Recommended operating conditions
		  • Added a new Note
		
		• In section, Voltage regulator electrical characteristics
		  • In table, Voltage regulator electrical specifications:
		  • Added a new row for $C_{HV\_VDD\_B}$
		  • Added a footnote on $V_{DD\_HV\_BALLAST}$
		  • Added a new Note at the end of this section
		
		• In section, Voltage monitor electrical characteristics
		  • In table, Voltage monitor electrical characteristics:
		  • Removed "V_{LVD_FLASH}" and "V_{LVD_FLASH} during low power mode using LPBG as reference" rows
		  • Updated Fall and Rise trimmed Minimum values for $V_{HVD\_LV\_cold}$
		
		• In section, Supply current characteristics
		  • In table, Current consumption characteristics:
		  • Updated the footnote mentioned in the Condition column of I_{DD_STOP} row
		  • Updated all TBD values
		  • In table, Low Power Unit (LPU) Current consumption characteristics:
		  • Updated the typical value of LPU_STOP to 0.18 mA
		  • Updated all TBD values
		  • In table, STANDBY Current consumption characteristics:
		  • Updated all TBD values
		
		• In section, AC specifications @ 3.3 V Range
		  • In table, Functional Pad AC Specifications @ 3.3 V Range:
		  • Updated Rise/Fall Edge values
		
		• In section, DC electrical specifications @ 3.3V Range
		  • In table, DC electrical specifications @ 3.3V Range:
		  • Updated Max value for Vol to 0.1 * VDD_HV_x
		
		• In section, AC specifications @ 5 V Range
		  • In table, Functional Pad AC Specifications @ 5 V Range:
		  • Updated Rise/Fall Edge values
		
		• In section, DC electrical specifications @ 5 V Range
		  • In table, DC electrical specifications @ 5 V Range:
		  • Updated Min and Max values for Pull_Ioh and Pull_Iol rows
		  • Updated Max value for Vol to 0.1 * VDD_HV_x
		
		• In section, Reset pad electrical characteristics
		  • In table, Functional reset pad electrical specifications:
		  • Updated parameter column for V_{IH}, V_{IL} and V_{HYS} rows
		  • Updated Min and Max values for V_{IH} and V_{IL} rows
		
		• In section, PORST electrical specifications
		  • In table, PORST electrical specifications:
		  • Updated Unit and Min/Max values for V_{IH} and V_{IL} rows
		
		• In section, Input equivalent circuit and ADC conversion characteristics
		  • In table, ADC conversion characteristics (for 12-bit):
		  • Updated "ADC Analog Pad (pad going to one ADC)" row
		  • In table, ADC conversion characteristics (for 10-bit):
		  • Updated "ADC Analog Pad (pad going to one ADC)" row
		
		• In section, Analog Comparator (CMP) electrical specifications
		  • In table, Comparator and 6-bit DAC electrical specifications:
		  • Updated Min and Max values for V_{AIO} to +47 mV
		  • Updated Max value for t_{DLS} to 21 µs
		
		• In section, Main oscillator electrical characteristics
		  • In table, Main oscillator electrical characteristics:

Table 51. Revision History (continued)

Rev. No.	Date	Substantial Changes

Rev 4	9 March 2016	• In section, Voltage regulator electrical characteristics
		  • In table, Voltage regulator electrical specifications:
		  • Updated the footnote on $V_{DD\_HV\_BALLAST}$

Rev 5	27 February 2017	• In Family Comparison section:
		  • Updated the "MPC5746C Family Comparison" table.
		  • added "NVM Memory Map 1", "NVM Memory Map 2", and "RAM Memory Map" tables.
		
		• Updated the product version, flash memory size and optional fields information in Ordering Information section.
		
		• In Recommended Operating Conditions section, removed the note related to additional crossover current.
		
		• VDD_HV_C row added in "Voltage regulator electrical specifications" table in Voltage regulator electrical characteristics section.
		
		• In Voltage Monitor Electrical Characteristics section, updated the "Trimmed" Fall and Rise specs of VHVD_LV_cold parameter in "Voltage Monitor Electrical Characteristics" table.
		
		• In AC Electrical Specifications: 3.3 V Range section, changed the occurrences of “ipp_sre[1:0]” to “SIUL2_MSCRn.SRC[1:0]” in the table.
		• In DC Electrical Specifications: 3.3 V Range section, changed the occurrences of “ipp_sre[1:0]” to “SIUL2_MSCRn.SRC[1:0]” and updated "Vol min and max" values in the table.
		• In AC Electrical Specifications: 5 V Range section, changed the occurrences of “ipp_sre[1:0]” to “SIUL2_MSCRn.SRC[1:0]” in the table.
		• In DC Electrical Specifications: 5 V Range section, changed the occurrences of “ipp_sre[1:0]” to “SIUL2_MSCRn.SRC[1:0]” and updated "Vol min and max" values in the table.
		
		• In "Flash memory AC timing specifications" table in Flash memory AC timing specifications section:
		  • Updated the "t_{psus}" typ value from 7 us to 9.4 us.
		  • Updated the "t_{psus}" max value from 9.1 us to 11.5 us.
		
		• Added "Continuous SCK Timing" table in DSPI timing section.
		
		• Added "ADC pad leakage" at 105°C TA conditions in "ADC conversion characteristics (for 12-bit)" table in ADC electrical specifications section.
		
		• In "STANDBY Current consumption characteristics" table in Supply current characteristics section:
		  • Updated the Typ and max values of IDD Standby current.
		  • Added IDD Standby3 current spec for FIRC ON.
		
		• Removed IVDDHV and IVDDLV specs in 16 MHz RC Oscillator electrical specifications section.
		
		• Added Reset Sequence section, with Reset Sequence Duration, BAF execution duration section, and Reset Sequence Distribution as its sub-sections.
