What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

3 Ordering parts

3.1 Determining valid orderable parts

To determine the orderable part numbers for this device, go to www.nxp.com and perform a part number search for the following device number: MPC5746C.

4.2 Recommended operating conditions

The following table describes the operating conditions for the device, and for which all specifications in the data sheet are valid, except where explicitly noted. The device operating conditions must not be exceeded in order to guarantee proper operation and reliability. The ranges in this table are design targets and actual data may vary in the given range.

NOTE

- For normal device operations, all supplies must be within operating range corresponding to the range mentioned in following tables. This is required even if some of the features are not used.
- If VDD_HV_A is in 3.3V range, VDD_HV_FLA should be externally supplied using a 3.3V source. If VDD_HV_A is in 3.3V range, VDD_HV_FLA should be shorted to VDD_HV_A.
- VDD_HV_A, VDD_HV_B and VDD_HV_C are all independent supplies and can each be set to 3.3V or 5V. The following tables: 'Recommended operating conditions (VDD_HV_x = 3.3 V)' and table 'Recommended operating conditions (VDD_HV_x = 5 V)' specify their ranges when configured in 3.3V or 5V respectively.

1. All monitors that are active at power-up will gate the power up recovery and prevent exit from POWERUP phase until the minimum level is crossed. These monitors can in some cases be masked during normal device operation, but when active will always generate a destructive reset.
2. Voltage monitors marked as non maskable are essential for device operation and hence cannot be masked.
3. There is no voltage monitoring on the $V_{DD\_HV\_ADC0}$, $V_{DD\_HV\_ADC1}$, $V_{DD\_HV\_B}$ and $V_{DD\_HV\_C}$ I/O segments. For applications requiring monitoring of these segments, either connect these to $V_{DD\_HV\_A}$ at the PCB level or monitor externally.

4.6 Electrostatic discharge (ESD) characteristics

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n + 1) supply pin). This test conforms to the AEC-Q100-002/-003/-011 standard.

NOTE

A device will be defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements. Complete DC parametric and functional testing shall be performed per applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.
