

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	20MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, POR, WDT
Number of I/O	13
Program Memory Size	1.75KB (1K x 14)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	68 x 8
Voltage - Supply (Vcc/Vdd)	4V ~ 6V
Data Converters	A/D 4x8b
Oscillator Type	External
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	18-SOIC (0.295", 7.50mm Width)
Supplier Device Package	18-SOIC
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/pic16c711t-20-so">https://www.e-xfl.com/product-detail/microchip-technology/pic16c711t-20-so</a>

## 2.0 PIC16C71X DEVICE VARIETIES

A variety of frequency ranges and packaging options are available. Depending on application and production requirements, the proper device option can be selected using the information in the PIC16C71X Product Identification System section at the end of this data sheet. When placing orders, please use that page of the data sheet to specify the correct part number.

For the PIC16C71X family, there are two device "types" as indicated in the device number:

1. **C**, as in PIC16**C**71. These devices have EPROM type memory and operate over the standard voltage range.
2. **LC**, as in PIC16**LC**71. These devices have EPROM type memory and operate over an extended voltage range.

### 2.1 UV Erasable Devices

The UV erasable version, offered in Cerdip package is optimal for prototype development and pilot programs. This version can be erased and reprogrammed to any of the oscillator modes.

Microchip's PICSTART® Plus and PRO MATE® II programmers both support programming of the PIC16C71X.

### 2.2 One-Time-Programmable (OTP) Devices

The availability of OTP devices is especially useful for customers who need the flexibility for frequent code updates and small volume applications.

The OTP devices, packaged in plastic packages, permit the user to program them once. In addition to the program memory, the configuration bits must also be programmed.

### 2.3 Quick-Turnaround-Production (QTP) Devices

Microchip offers a QTP Programming Service for factory production orders. This service is made available for users who choose not to program a medium to high quantity of units and whose code patterns have stabilized. The devices are identical to the OTP devices but with all EPROM locations and configuration options already programmed by the factory. Certain code and prototype verification procedures apply before production shipments are available. Please contact your local Microchip Technology sales office for more details.

### 2.4 Serialized Quick-Turnaround Production (SQTP<sup>SM</sup>) Devices

Microchip offers a unique programming service where a few user-defined locations in each device are programmed with different serial numbers. The serial numbers may be random, pseudo-random, or sequential.

Serial programming allows each device to have a unique number which can serve as an entry-code, password, or ID number.

## 6.3.1 SWITCHING PRESCALER ASSIGNMENT

The prescaler assignment is fully under software control, i.e., it can be changed “on the fly” during program execution.

**Note:** To avoid an unintended device RESET, the following instruction sequence (shown in Example 6-1) must be executed when changing the prescaler assignment from Timer0 to the WDT. This sequence must be followed even if the WDT is disabled.

### EXAMPLE 6-1: CHANGING PRESCALER (TIMER0→WDT)

```
BCF    STATUS, RP0    ;Bank 0
CLRF   TMR0           ;Clear TMR0 & Prescaler
BSF    STATUS, RP0    ;Bank 1
CLRWDT           ;Clears WDT
MOVLW  b'xxxxlxxx'   ;Selects new prescale value
MOVWF  OPTION_REG     ;and assigns the prescaler to the WDT
BCF    STATUS, RP0    ;Bank 0
```

To change prescaler from the WDT to the Timer0 module use the sequence shown in Example 6-2.

### EXAMPLE 6-2: CHANGING PRESCALER (WDT→TIMER0)

```
CLRWDT           ;Clear WDT and prescaler
BSF    STATUS, RP0    ;Bank 1
MOVLW  b'xxx0xxx'    ;Select TMR0, new prescale value and
MOVWF  OPTION_REG     ;clock source
BCF    STATUS, RP0    ;Bank 0
```

**TABLE 6-1: REGISTERS ASSOCIATED WITH TIMER0**

Address	Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on: POR, BOR	Value on all other resets
01h	TMR0	Timer0 module's register								xxxx xxxx	uuuu uuuu
0Bh,8Bh,	INTCON	GIE	ADIE	TOIE	INTE	RBIE	TOIF	INTF	RBIF	0000 000x	0000 000u
81h	OPTION	<u>RBPU</u>	INTEDG	T0CS	T0SE	PSA	PS2	PS1	PS0	1111 1111	1111 1111
85h	TRISA	—	—	—	PORTA Data Direction Register					---1 1111	---1 1111

Legend: x = unknown, u = unchanged, - = unimplemented locations read as '0'. Shaded cells are not used by Timer0.

## 7.5 A/D Operation During Sleep

The A/D module can operate during SLEEP mode. This requires that the A/D clock source be set to RC (ADCS1:ADCS0 = 11). When the RC clock source is selected, the A/D module waits one instruction cycle before starting the conversion. This allows the SLEEP instruction to be executed, which eliminates all digital switching noise from the conversion. When the conversion is completed the GO/DONE bit will be cleared, and the result loaded into the ADRES register. If the A/D interrupt is enabled, the device will wake-up from SLEEP. If the A/D interrupt is not enabled, the A/D module will then be turned off, although the ADON bit will remain set.

When the A/D clock source is another clock option (not RC), a SLEEP instruction will cause the present conversion to be aborted and the A/D module to be turned off, though the ADON bit will remain set.

Turning off the A/D places the A/D module in its lowest current consumption state.

**Note:** For the A/D module to operate in SLEEP, the A/D clock source must be set to RC (ADCS1:ADCS0 = 11). To perform an A/D conversion in SLEEP, ensure the SLEEP instruction immediately follows the instruction that sets the GO/DONE bit.

## 7.6 A/D Accuracy/Error

The absolute accuracy specified for the A/D converter includes the sum of all contributions for quantization error, integral error, differential error, full scale error, offset error, and monotonicity. It is defined as the maximum deviation from an actual transition versus an ideal transition for any code. The absolute error of the A/D converter is specified at  $\pm 1$  LSB for  $V_{DD} = V_{REF}$  (over the device's specified operating range). However, the accuracy of the A/D converter will degrade as  $V_{DD}$  diverges from  $V_{REF}$ .

For a given range of analog inputs, the output digital code will be the same. This is due to the quantization of the analog input to a digital code. Quantization error is typically  $\pm 1/2$  LSB and is inherent in the analog to digital conversion process. The only way to reduce quantization error is to increase the resolution of the A/D converter.

Offset error measures the first actual transition of a code versus the first ideal transition of a code. Offset error shifts the entire transfer function. Offset error can be calibrated out of a system or introduced into a system through the interaction of the total leakage current and source impedance at the analog input.

Gain error measures the maximum deviation of the last actual transition and the last ideal transition adjusted for offset error. This error appears as a change in slope of the transfer function. The difference in gain error to

full scale error is that full scale does not take offset error into account. Gain error can be calibrated out in software.

Linearity error refers to the uniformity of the code changes. Linearity errors cannot be calibrated out of the system. Integral non-linearity error measures the actual code transition versus the ideal code transition adjusted by the gain error for each code.

Differential non-linearity measures the maximum actual code width versus the ideal code width. This measure is unadjusted.

In systems where the device frequency is low, use of the A/D RC clock is preferred. At moderate to high frequencies, TAD should be derived from the device oscillator. TAD must not violate the minimum and should be  $\leq 8 \mu s$  for preferred operation. This is because TAD, when derived from TOSC, is kept away from on-chip phase clock transitions. This reduces, to a large extent, the effects of digital switching noise. This is not possible with the RC derived clock. The loss of accuracy due to digital switching noise can be significant if many I/O pins are active.

In systems where the device will enter SLEEP mode after the start of the A/D conversion, the RC clock source selection is required. In this mode, the digital noise from the modules in SLEEP are stopped. This method gives high accuracy.

## 7.7 Effects of a RESET

A device reset forces all registers to their reset state. This forces the A/D module to be turned off, and any conversion is aborted.

The value that is in the ADRES register is not modified for a Power-on Reset. The ADRES register will contain unknown data after a Power-on Reset.

## 7.8 Connection Considerations

If the input voltage exceeds the rail values ( $V_{SS}$  or  $V_{DD}$ ) by greater than 0.2V, then the accuracy of the conversion is out of specification.

**Note:** Care must be taken when using the RA0 pin in A/D conversions due to its proximity to the OSC1 pin.

An external RC filter is sometimes added for anti-aliasing of the input signal. The R component should be selected to ensure that the total source impedance is kept under the 10 k $\Omega$  recommended specification. Any external components connected (via hi-impedance) to an analog input pin (capacitor, zener diode, etc.) should have very little leakage current at the pin.

**TABLE 8-12: INITIALIZATION CONDITIONS FOR ALL REGISTERS, PIC16C710/71/711**

Register	Power-on Reset, Brown-out Reset <sup>(5)</sup>	MCLR Resets WDT Reset	Wake-up via WDT or Interrupt
W	xxxx xxxx	uuuu uuuu	uuuu uuuu
INDF	N/A	N/A	N/A
TMR0	xxxx xxxx	uuuu uuuu	uuuu uuuu
PCL	0000h	0000h	PC + 1 <sup>(2)</sup>
STATUS	0001 1xxx	000q quuu <sup>(3)</sup>	uuuq quuu <sup>(3)</sup>
FSR	xxxx xxxx	uuuu uuuu	uuuu uuuu
PORTA	---x 0000	---u 0000	---u uuuu
PORTB	xxxx xxxx	uuuu uuuu	uuuu uuuu
PCLATH	---0 0000	---0 0000	---u uuuu
INTCON	0000 000x	0000 000u	uuuu uuuu <sup>(1)</sup>
ADRES	xxxx xxxx	uuuu uuuu	uuuu uuuu
ADCON0	00-0 0000	00-0 0000	uu-u uuuu
OPTION	1111 1111	1111 1111	uuuu uuuu
TRISA	---1 1111	---1 1111	---u uuuu
TRISB	1111 1111	1111 1111	uuuu uuuu
PCON <sup>(4)</sup>	---- --0u	---- --uu	---- --uu
ADCON1	---- --00	---- --00	---- --uu

Legend: u = unchanged, x = unknown, - = unimplemented bit, read as '0', q = value depends on condition

Note 1: One or more bits in INTCON will be affected (to cause wake-up).

2: When the wake-up is due to an interrupt and the GIE bit is set, the PC is loaded with the interrupt vector (0004h).

3: See Table 8-10 for reset value for specific condition.

4: The PCON register is not implemented on the PIC16C71.

5: Brown-out reset is not implemented on the PIC16C71.

# PIC16C71X

---

## 8.6 Context Saving During Interrupts

During an interrupt, only the return PC value is saved on the stack. Typically, users may wish to save key registers during an interrupt i.e., W register and STATUS register. This will have to be implemented in software.

Example 8-1 stores and restores the STATUS and W registers. The user register, STATUS\_TEMP, must be defined in bank 0.

The example:

- a) Stores the W register.
- b) Stores the STATUS register in bank 0.
- c) Executes the ISR code.
- d) Restores the STATUS register (and bank select bit).
- e) Restores the W register.

### EXAMPLE 8-1: SAVING STATUS AND W REGISTERS IN RAM

```
MOVWF    W_TEMP          ;Copy W to TEMP register, could be bank one or zero
SWAPF    STATUS,W         ;Swap status to be saved into W
MOVWF    STATUS_TEMP      ;Save status to bank zero STATUS_TEMP register
:
: (ISR)
:
SWAPF    STATUS_TEMP,W    ;Swap STATUS_TEMP register into W
                        ;(sets bank to original state)
MOVWF    STATUS           ;Move W into STATUS register
SWAPF    W_TEMP,F         ;Swap W_TEMP
SWAPF    W_TEMP,W         ;Swap W_TEMP into W
```

**FIGURE 8-22: WAKE-UP FROM SLEEP THROUGH INTERRUPT**

## 8.9 Program Verification/Code Protection

If the code protection bit(s) have not been programmed, the on-chip program memory can be read out for verification purposes.

**Note:** Microchip does not recommend code protecting windowed devices.

## 8.10 ID Locations

Four memory locations (2000h - 2003h) are designated as ID locations where the user can store checksum or other code-identification numbers. These locations are not accessible during normal execution but are readable and writable during program/verify. It is recommended that only the 4 least significant bits of the ID location are used.

## 8.11 In-Circuit Serial Programming

PIC16CXX microcontrollers can be serially programmed while in the end application circuit. This is simply done with two lines for clock and data, and three other lines for power, ground, and the programming voltage. This allows customers to manufacture boards with unprogrammed devices, and then program the microcontroller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

The device is placed into a program/verify mode by holding the RB6 and RB7 pins low while raising the MCLR (VPP) pin from VIL to VIH (see programming specification). RB6 becomes the programming clock and RB7 becomes the programming data. Both RB6 and RB7 are Schmitt Trigger inputs in this mode.

After reset, to place the device into programming/verify mode, the program counter (PC) is at location 00h. A 6-bit command is then supplied to the device. Depending on the command, 14-bits of program data are then supplied to or from the device, depending if the command was a load or a read. For complete details of serial programming, please refer to the PIC16C6X/7X Programming Specifications (Literature #DS30228).

**FIGURE 8-23: TYPICAL IN-CIRCUIT SERIAL PROGRAMMING CONNECTION**

# PIC16C71X

## BCF Bit Clear f

Syntax: `[label] BCF f,b`

Operands:  $0 \leq f \leq 127$   
 $0 \leq b \leq 7$

Operation:  $0 \rightarrow (f<b>)$

Status Affected: None

Encoding: 

01	00bb	bfff	ffff
----	------	------	------

Description: Bit 'b' in register 'f' is cleared.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process data	Write register 'f'

Example

```
BCF    FLAG_REG, 7

Before Instruction
FLAG_REG = 0xC7
After Instruction
FLAG_REG = 0x47
```

## BSF Bit Set f

Syntax: `[label] BSF f,b`

Operands:  $0 \leq f \leq 127$   
 $0 \leq b \leq 7$

Operation:  $1 \rightarrow (f<b>)$

Status Affected: None

Encoding: 

01	01bb	bfff	ffff
----	------	------	------

Description: Bit 'b' in register 'f' is set.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process data	Write register 'f'

Example

```
BSF    FLAG_REG, 7

Before Instruction
FLAG_REG = 0x0A
After Instruction
FLAG_REG = 0x8A
```

## BTFSC Bit Test, Skip if Clear

Syntax: `[label] BTFSC f,b`

Operands:  $0 \leq f \leq 127$   
 $0 \leq b \leq 7$

Operation: skip if  $(f<b>) = 0$

Status Affected: None

Encoding: 

01	10bb	bfff	ffff
----	------	------	------

Description: If bit 'b' in register 'f' is '1' then the next instruction is executed.  
 If bit 'b', in register 'f', is '0' then the next instruction is discarded, and a NOP is executed instead, making this a 2Tcy instruction.

Words: 1

Cycles: 1(2)

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process data	NOP

If Skip: (2nd Cycle)

Q1	Q2	Q3	Q4
NOP	NOP	NOP	NOP

Example

```
HERE    BTFSC FLAG, 1
FALSE   GOTO  PROCESS_CODE
TRUE    :
```

Before Instruction  
 PC = address HERE  
 After Instruction  
 if  $FLAG<1> = 0$ ,  
 PC = address TRUE  
 if  $FLAG<1> = 1$ ,  
 PC = address FALSE

## BTFSS Bit Test f, Skip if Set

Syntax: `[label] BTFSS f,b`

Operands:  $0 \leq f \leq 127$   
 $0 \leq b < 7$

Operation: skip if  $(f < b) = 1$

Status Affected: None

Encoding:

01	11bb	bfff	ffff
----	------	------	------

Description: If bit 'b' in register 'f' is '0' then the next instruction is executed.  
 If bit 'b' is '1', then the next instruction is discarded and a NOP is executed instead, making this a 2TCY instruction.

Words: 1

Cycles: 1(2)

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process data	NOP

If Skip: (2nd Cycle)

Q1	Q2	Q3	Q4
NOP	NOP	NOP	NOP

### Example

```

HERE   BTFSC  FLAG,1
FALSE  GOTO   PROCESS_CODE
TRUE   •
        •
        •
    
```

Before Instruction

PC = address HERE

After Instruction

```

if FLAG<1> = 0,
PC = address FALSE
if FLAG<1> = 1,
PC = address TRUE
    
```

## CALL Call Subroutine

Syntax: `[label] CALL k`

Operands:  $0 \leq k \leq 2047$

Operation:  $(PC)+1 \rightarrow TOS$ ,  
 $k \rightarrow PC<10:0>$ ,  
 $(PCLATH<4:3>) \rightarrow PC<12:11>$

Status Affected: None

Encoding:

10	0kkk	kkkk	kkkk
----	------	------	------

Description: Call Subroutine. First, return address  $(PC+1)$  is pushed onto the stack. The eleven bit immediate address is loaded into PC bits  $<10:0>$ . The upper bits of the PC are loaded from PCLATH. CALL is a two cycle instruction.

Words: 1

Cycles: 2

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read literal 'k', Push PC to Stack	Process data	Write to PC
NOP	NOP	NOP	NOP

1st Cycle

2nd Cycle

### Example

```

HERE   CALL   THERE
    
```

Before Instruction

PC = Address HERE

After Instruction

PC = Address THERE

TOS = Address HERE+1

INCFSZ		Increment f, Skip if 0										
Syntax:	[ <i>label</i> ] INCFSZ f,d											
Operands:	$0 \leq f \leq 127$ $d \in [0,1]$											
Operation:	$(f) + 1 \rightarrow (\text{dest})$ , skip if result = 0											
Status Affected:	None											
Encoding:	<table><tr><td>00</td><td>1111</td><td>dfff</td><td>ffff</td></tr></table>				00	1111	dfff	ffff				
00	1111	dfff	ffff									
Description:	<p>The contents of register 'f' are incremented. If 'd' is 0 the result is placed in the W register. If 'd' is 1 the result is placed back in register 'f'. If the result is 1, the next instruction is executed. If the result is 0, a NOP is executed instead making it a 2Tcy instruction.</p>											
Words:	1											
Cycles:	1(2)											
Q Cycle Activity:	<table><tr><td>Q1</td><td>Q2</td><td>Q3</td><td>Q4</td></tr><tr><td>Decode</td><td>Read register 'f'</td><td>Process data</td><td>Write to dest</td></tr></table>				Q1	Q2	Q3	Q4	Decode	Read register 'f'	Process data	Write to dest
Q1	Q2	Q3	Q4									
Decode	Read register 'f'	Process data	Write to dest									
If Skip:	(2nd Cycle)											
	<table><tr><td>Q1</td><td>Q2</td><td>Q3</td><td>Q4</td></tr><tr><td>NOP</td><td>NOP</td><td>NOP</td><td>NOP</td></tr></table>				Q1	Q2	Q3	Q4	NOP	NOP	NOP	NOP
Q1	Q2	Q3	Q4									
NOP	NOP	NOP	NOP									

## Example

```

HERE      INCFSZ    CNT, 1
          GOTO      LOOP
CONTINUE  •
          •
          •

```

### Before Instruction

PC = address HERE

### After Instruction

```

CNT = CNT + 1
if CNT= 0,
PC = address CONTINUE
if CNT≠ 0,
PC = address HERE +1

```

IORLW		Inclusive OR Literal with W						
Syntax:	[ <i>label</i> ] IORLW k							
Operands:	$0 \leq k \leq 255$							
Operation:	(W) .OR. k $\rightarrow$ (W)							
Status Affected:	Z							
Encoding:	<table><tr><td>11</td><td>1000</td><td>kkkk</td><td>kkkk</td></tr></table>				11	1000	kkkk	kkkk
11	1000	kkkk	kkkk					
Description:	The contents of the W register is OR'ed with the eight bit literal 'k'. The result is placed in the W register.							
Words:	1							
Cycles:	1							
Q Cycle Activity:	Q1	Q2	Q3	Q4				
	Decode	Read literal 'k'	Process data	Write to W				

## Example

```
IORLW 0x35
```

### Before Instruction

W = 0x9A

### After Instruction

```

W = 0xBF
Z = 1

```

# PIC16C71X

## SLEEP

Syntax: [ *label* ] SLEEP

Operands: None

Operation: 00h → WDT,  
0 → WDT prescaler,  
1 →  $\overline{TO}$ ,  
0 →  $\overline{PD}$

Status Affected:  $\overline{TO}$ ,  $\overline{PD}$

Encoding: 

00	0000	0110	0011
----	------	------	------

Description: The power-down status bit,  $\overline{PD}$  is cleared. Time-out status bit,  $\overline{TO}$  is set. Watchdog Timer and its prescaler are cleared. The processor is put into SLEEP mode with the oscillator stopped. See Section 8.8 for more details.

Words: 1

Cycles: 1

Q Cycle Activity: 

Q1	Q2	Q3	Q4
Decode	NOP	NOP	Go to Sleep

Example: SLEEP

## SUBLW

### Subtract W from Literal

Syntax: [ *label* ] SUBLW k

Operands:  $0 \leq k \leq 255$

Operation:  $k - (W) \rightarrow (W)$

Status Affected: C, DC, Z

Encoding: 

11	110x	kkkk	kkkk
----	------	------	------

Description: The W register is subtracted (2's complement method) from the eight bit literal 'k'. The result is placed in the W register.

Words: 1

Cycles: 1

Q Cycle Activity: 

Q1	Q2	Q3	Q4
Decode	Read literal 'k'	Process data	Write to W

Example 1: SUBLW 0x02

Before Instruction

W = 1  
C = ?  
Z = ?

After Instruction

W = 1  
C = 1; result is positive  
Z = 0

Example 2: Before Instruction

W = 2  
C = ?  
Z = ?

After Instruction

W = 0  
C = 1; result is zero  
Z = 1

Example 3: Before Instruction

W = 3  
C = ?  
Z = ?

After Instruction

W = 0xFF  
C = 0; result is negative  
Z = 0

## 10.0 DEVELOPMENT SUPPORT

### 10.1 Development Tools

The PICmicro™ microcontrollers are supported with a full range of hardware and software development tools:

- PICMASTER/PICMASTER CE Real-Time In-Circuit Emulator
- ICEPIC Low-Cost PIC16C5X and PIC16CXXX In-Circuit Emulator
- PRO MATE® II Universal Programmer
- PICSTART® Plus Entry-Level Prototype Programmer
- PICDEM-1 Low-Cost Demonstration Board
- PICDEM-2 Low-Cost Demonstration Board
- PICDEM-3 Low-Cost Demonstration Board
- MPASM Assembler
- MPLAB™ SIM Software Simulator
- MPLAB-C (C Compiler)
- Fuzzy Logic Development System (*fuzzyTECH®*-MP)

### 10.2 PICMASTER: High Performance Universal In-Circuit Emulator with MPLAB IDE

The PICMASTER Universal In-Circuit Emulator is intended to provide the product development engineer with a complete microcontroller design tool set for all microcontrollers in the PIC12CXXX, PIC14C000, PIC16C5X, PIC16CXXX and PIC17CXX families. PICMASTER is supplied with the MPLAB™ Integrated Development Environment (IDE), which allows editing, "make" and download, and source debugging from a single environment.

Interchangeable target probes allow the system to be easily reconfigured for emulation of different processors. The universal architecture of the PICMASTER allows expansion to support all new Microchip microcontrollers.

The PICMASTER Emulator System has been designed as a real-time emulation system with advanced features that are generally found on more expensive development tools. The PC compatible 386 (and higher) machine platform and Microsoft Windows® 3.x environment were chosen to best make these features available to you, the end user.

A CE compliant version of PICMASTER is available for European Union (EU) countries.

### 10.3 ICEPIC: Low-Cost PIC16CXXX In-Circuit Emulator

ICEPIC is a low-cost in-circuit emulator solution for the Microchip PIC16C5X and PIC16CXXX families of 8-bit OTP microcontrollers.

ICEPIC is designed to operate on PC-compatible machines ranging from 286-AT® through Pentium™ based machines under Windows 3.x environment. ICEPIC features real time, non-intrusive emulation.

### 10.4 PRO MATE II: Universal Programmer

The PRO MATE II Universal Programmer is a full-featured programmer capable of operating in stand-alone mode as well as PC-hosted mode.

The PRO MATE II has programmable VDD and VPP supplies which allows it to verify programmed memory at VDD min and VDD max for maximum reliability. It has an LCD display for displaying error messages, keys to enter commands and a modular detachable socket assembly to support various package types. In stand-alone mode the PRO MATE II can read, verify or program PIC12CXXX, PIC14C000, PIC16C5X, PIC16CXXX and PIC17CXX devices. It can also set configuration and code-protect bits in this mode.

### 10.5 PICSTART Plus Entry Level Development System

The PICSTART programmer is an easy-to-use, low-cost prototype programmer. It connects to the PC via one of the COM (RS-232) ports. MPLAB Integrated Development Environment software makes using the programmer simple and efficient. PICSTART Plus is not recommended for production programming.

PICSTART Plus supports all PIC12CXXX, PIC14C000, PIC16C5X, PIC16CXXX and PIC17CXX devices with up to 40 pins. Larger pin count devices such as the PIC16C923 and PIC16C924 may be supported with an adapter socket.

<b>DC CHARACTERISTICS</b> <b>Standard Operating Conditions (unless otherwise stated)</b> Operating temperature    0°C    ≤ TA ≤ +70°C (commercial) -40°C    ≤ TA ≤ +85°C (industrial) -40°C    ≤ TA ≤ +125°C (extended) Operating voltage VDD range as described in DC spec Section 11.1 and Section 11.2.							
Param No.	Characteristic	Sym	Min	Typ †	Max	Units	Conditions

D092	OSC2/CLKOUT (RC osc config)		VDD - 0.7	-	-	V	IOH = -1.3 mA, VDD = 4.5V, -40°C to +85°C
D092A			VDD - 0.7	-	-	V	IOH = -1.0 mA, VDD = 4.5V, -40°C to +125°C
D130*	<b>Open-Drain High Voltage</b>	VOD	-	-	14	V	RA4 pin
<b>Capacitive Loading Specs on Output Pins</b>							
D100	OSC2 pin	COSC2	-	-	15	pF	In XT, HS and LP modes when external clock is used to drive OSC1.
D101	All I/O pins and OSC2 (in RC mode)	CIO	-	-	50	pF	

\* These parameters are characterized but not tested.

† Data in "Typ" column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: In RC oscillator configuration, the OSC1/CLKIN pin is a Schmitt Trigger input. It is not recommended that the PIC16C7X be driven with external clock in RC mode.

2: The leakage current on the  $\overline{\text{MCLR}}$  pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

3: Negative current is defined as current sourced by the pin.

## 11.4 Timing Parameter Symbolology

The timing parameter symbols have been created following one of the following formats:

1. TppS2ppS
2. TppS

<b>T</b>			
F	Frequency	T	Time

Lowercase letters (pp) and their meanings:

<b>pp</b>			
cc	CCP1	osc	OSC1
ck	CLKOUT	rd	RD
cs	CS	rw	RD or WR
di	SDI	sc	SCK
do	SDO	ss	SS
dt	Data in	t0	T0CKI
io	I/O port	t1	T1CKI
mc	MCLR	wr	WR

Uppercase letters and their meanings:

<b>S</b>			
F	Fall	P	Period
H	High	R	Rise
I	Invalid (Hi-impedance)	V	Valid
L	Low	Z	Hi-impedance

D023	Brown-out Reset Current (Note 5)	ΔIBOR	-	300*	500	μA	BOR enabled VDD = 5.0V

\* These parameters are characterized but not tested.

† Data in "Typ" column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: This is the limit to which VDD can be lowered in SLEEP mode without losing RAM data.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as I/O pin loading and switching rate, oscillator type, internal code execution pattern, and temperature also have an impact on the current consumption.

The test conditions for all IDD measurements in active operation mode are:

OSC1 = external square wave, from rail to rail; all I/O pins tristated, pulled to VDD

MCLR = VDD; WDT enabled/disabled as specified.

3: The power-down current in SLEEP mode does not depend on the oscillator type. Power-down current is measured with the part in SLEEP mode, with all I/O pins in hi-impedance state and tied to VDD and VSS.

4: For RC osc configuration, current through Rext is not included. The current through the resistor can be estimated by the formula  $I_r = VDD/2R_{ext}$  (mA) with Rext in kOhm.

5: The Δ current is the additional current consumed when this peripheral is enabled. This current should be added to the base IDD or IPD measurement.

13.4 Timing Parameter Symbology

The timing parameter symbols have been created following one of the following formats:

- 1. TppS2ppS
- 2. TppS

T			
F	Frequency	T	Time

Lowercase letters (pp) and their meanings:

pp			
cc	CCP1	osc	OSC1
ck	CLKOUT	rd	RD
