
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	64MHz
Connectivity	I²C, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, HLVD, POR, PWM, WDT
Number of I/O	25
Program Memory Size	128KB (64K x 16)
Program Memory Type	FLASH
EEPROM Size	1K x 8
RAM Size	8K x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 24x12b; D/A 1x5b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18lf27k42-i-so

Legend: Unimplemented data memory locations and registers, read as '0'.

Note 1: Unimplemented in LF devices.

2: Unimplemented in PIC18(L)F26/27K42.

3: Unimplemented in PIC18(L)F26/27/45/46/47K42.

4.8.3 MAPPING THE ACCESS BANK IN INDEXED LITERAL OFFSET MODE

The use of Indexed Literal Offset Addressing mode effectively changes how the first 96 locations of Access RAM (00h to 5Fh) are mapped. Rather than containing just the contents of the bottom section of Bank 0, this mode maps the contents from a user defined “window” that can be located anywhere in the data memory space. The value of FSR2 establishes the lower boundary of the addresses mapped into the window, while the upper boundary is defined by FSR2 plus 95 (5Fh). Addresses in the Access RAM above 5Fh are mapped as previously described (see **Section 4.5.4 “Access Bank”**). An example of Access Bank remapping in this addressing mode is shown in Figure 4-8.

Remapping of the Access Bank applies *only* to operations using the Indexed Literal Offset mode. Operations that use the BSR (Access RAM bit is ‘1’) will continue to use direct addressing as before.

4.9 PIC18 Instruction Execution and the Extended Instruction Set

Enabling the extended instruction set adds eight additional commands to the existing PIC18 instruction set. These instructions are executed as described in **Section 41.2 “Extended Instruction Set”**.

FIGURE 4-8: REMAPPING THE ACCESS BANK WITH INDEXED LITERAL OFFSET ADDRESSING

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
u = Bit is unchanged	x = Bit is unknown	-n/n = Value at POR and BOR/Value at all other Resets
'1' = Bit is set	'0' = Bit is cleared	

bit 7-2 **Unimplemented:** Read as '0'

bit 1 **VREGPM:** Voltage Regulator Power Mode Selection bit
- 1 = Low-Power Sleep mode enabled in Sleep(2)
  Draws lowest current in Sleep, slower wake-up
- 0 = Normal Power mode enabled in Sleep(2)
  Draws higher current in Sleep, faster wake-up

bit 0 **Reserved:** Read as '1'. Maintain this bit set.

Note 1: Not present in LF parts.

2: See **Section 44.0 "Electrical Specifications"**.

13.1.5 ERASING PROGRAM FLASH MEMORY

The minimum erase block is 64 words (refer to Table 5-4). Only through the use of an external programmer, or through ICSP™ control, can larger blocks of program memory be bulk erased. Word erase in the program memory array is not supported.

For example, when initiating an erase sequence from a microcontroller with erase row size of 64 words, a block of 64 words (128 bytes) of program memory is erased. The Most Significant 16 bits of the TBLPTR<21:6> point to the block being erased. The TBLPTR<5:0> bits are ignored.

The NVMCON1 register commands the erase operation. The REG<1:0> bits must be set to point to the Program Flash Memory. The WREN bit must be set to enable write operations. The FREE bit is set to select an erase operation.

The NVM unlock sequence described in **Section 13.1.4 "NVM Unlock Sequence"** should be used to guard against accidental writes. This is sometimes referred to as a long write.

A long write is necessary for erasing program memory. Instruction execution is halted during the long write cycle. The long write is terminated by the internal programming timer.

13.1.5.1 Program Flash Memory Erase Sequence

The sequence of events for erasing a block of internal program memory is:

1. REG bits of the NVMCON1 register point to PFM
2. Set the FREE and WREN bits of the NVMCON1 register
3. Perform the unlock sequence as described in **Section 13.1.4 "NVM Unlock Sequence"**

If the PFM address is write-protected, the WR bit will be cleared and the erase operation will not take place, WRERR is signaled in this scenario.

The operation erases the memory row indicated by masking the LSBs of the current TBLPTR.

While erasing PFM, CPU operation is suspended and it resumes when the operation is complete. Upon completion the WR bit is cleared in hardware, the NVMIF is set and an interrupt will occur if the NVMIE bit is also set.

Write latch data is not affected by erase operations and WREN will remain unchanged.

Note 1:	If a write or erase operation is terminated by an unexpected event, WRERR bit will set which user can check to decide whether a rewrite of the location(s) is needed.
2:	WRERR is set if WR is written to '1' while TBLPTR points to a write-protected address.
3:	WRERR is set if WR is written to '1' while TBLPTR points to an invalid address location (Table 13-1).

bit 7							bit 0

Legend:		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
u = Bit is unchanged	x = Bit is unknown	-n/n = Value at POR and BOR/Value at all other Resets
'1' = Bit is set	'0' = Bit is cleared	HC = Bit is cleared by hardware

bit 7 **EN:** Scanner Enable bit(1)
1 = Scanner is enabled
0 = Scanner is disabled

bit 6 **TRIGEN:** Scanner Trigger Enable bit(2)
1 = Scanner trigger is enabled
0 = Scanner trigger is disabled
Refer Table 14-1.

bit 5 **SGO:** Scanner GO bit(3, 4)
1 = When the CRC is ready, the Memory region set by the MREG bit will be accessed and data is passed to the CRC peripheral.
0 = Scanner operations will not occur

bit 4-3 **Unimplemented:** Read as '0'

bit 2 **MREG:** Scanner Memory Region Select bit(2)
1 = Scanner address points to Data EEPROM
0 = Scanner address points to Program Flash Memory

bit 1 **BURSTMD:** Scanner Burst Mode bit
1 = Memory access request to the CPU Arbiter is always true
0 = Memory access request to the CPU Arbiter is dependent on the CRC request and Trigger
Refer Table 14-1.

bit 0 **BUSY:** Scanner Busy Indicator bit
1 = Scanner cycle is in process
0 = Scanner cycle is compete (or never started)

Note 1: Setting EN = 1 (SCANCON0 register) does not affect any other register content.
2: Scanner trigger selection can be set using the SCANTRIG register.
3: This bit can be cleared in software. It is cleared in hardware when LADR>HADR (and a data cycle is not occurring) or when CRCGO = 0 (CRCCON0 register).
4: CRCEN and CRCGO bits (CRCCON0 register) must be set before setting the SGO bit.

PSYNC	CKPOL	CKSYNC	MODE<4:0>				
bit 7							bit 0

Legend:		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'
u = Bit is unchanged	x = Bit is unknown	-n/n = Value at POR and BOR/Value at all other Resets
'1' = Bit is set	'0' = Bit is cleared	

bit 7 **PSYNC:** Timerx Prescaler Synchronization Enable bit(1, 2)
1 = TxTMR Prescaler Output is synchronized to Fosc/4
0 = TxTMR Prescaler Output is not synchronized to Fosc/4

bit 6 **CKPOL:** Timerx Clock Polarity Selection bit(3)
1 = Falling edge of input clock clocks timer/prescaler
0 = Rising edge of input clock clocks timer/prescaler

bit 5 **CKSYNC:** Timerx Clock Synchronization Enable bit(4, 5)
1 = ON register bit is synchronized to T2TMR_clk input
0 = ON register bit is not synchronized to T2TMR_clk input

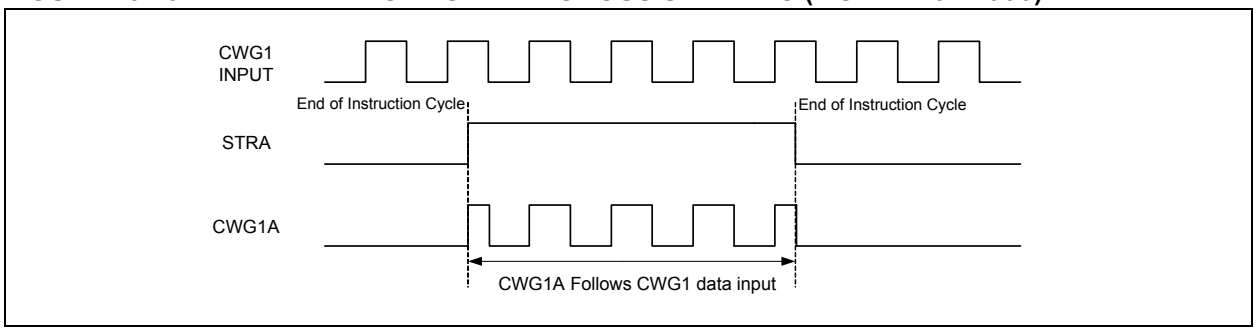
bit 4-0 **MODE<4:0>:** Timerx Control Mode Selection bits(6, 7)
See Table 22-1 for all operating modes.

Note 1: Setting this bit ensures that reading TxTMR will return a valid data value.
2: When this bit is '1', Timer2 cannot operate in Sleep mode.
3: CKPOL should not be changed while ON = 1.
4: Setting this bit ensures glitch-free operation when the ON is enabled or disabled.
5: When this bit is set then the timer operation will be delayed by two TxTMR input clocks after the ON bit is set.
6: Unless otherwise indicated, all modes start upon ON = 1 and stop upon ON = 0 (stops occur without affecting the value of TxTMR).
7: When TxTMR = TxPR, the next clock clears TxTMR, regardless of the operating mode.

26.2.4.2 Asynchronous Steering Mode

In Asynchronous mode (MODE<2:0> bits = 000, Register 26-1), steering takes effect at the end of the instruction cycle that writes to STR. In Asynchronous Steering mode, the output signal may be an incomplete waveform (Figure 26-10). This operation may be useful when the user firmware needs to immediately remove a signal from the output pin.

FIGURE 26-10: EXAMPLE OF ASYNCHRONOUS STEERING (MODE<2:0>= 000)



26.2.4.3 Start-up Considerations

The application hardware must use the proper external pull-up and/or pull-down resistors on the CWG output pins. This is required because all I/O pins are forced to high-impedance at Reset.

The POLy bits (Register 26-2) allow the user to choose whether the output signals are active-high or active-low.

26.12 Operation During Sleep

The CWG module operates independently from the system clock and will continue to run during Sleep, provided that the clock and input sources selected remain active.

The HFINTOSC remains active during Sleep when all the following conditions are met:

- CWG module is enabled
- Input source is active
- HFINTOSC is selected as the clock source, regardless of the system clock source selected.

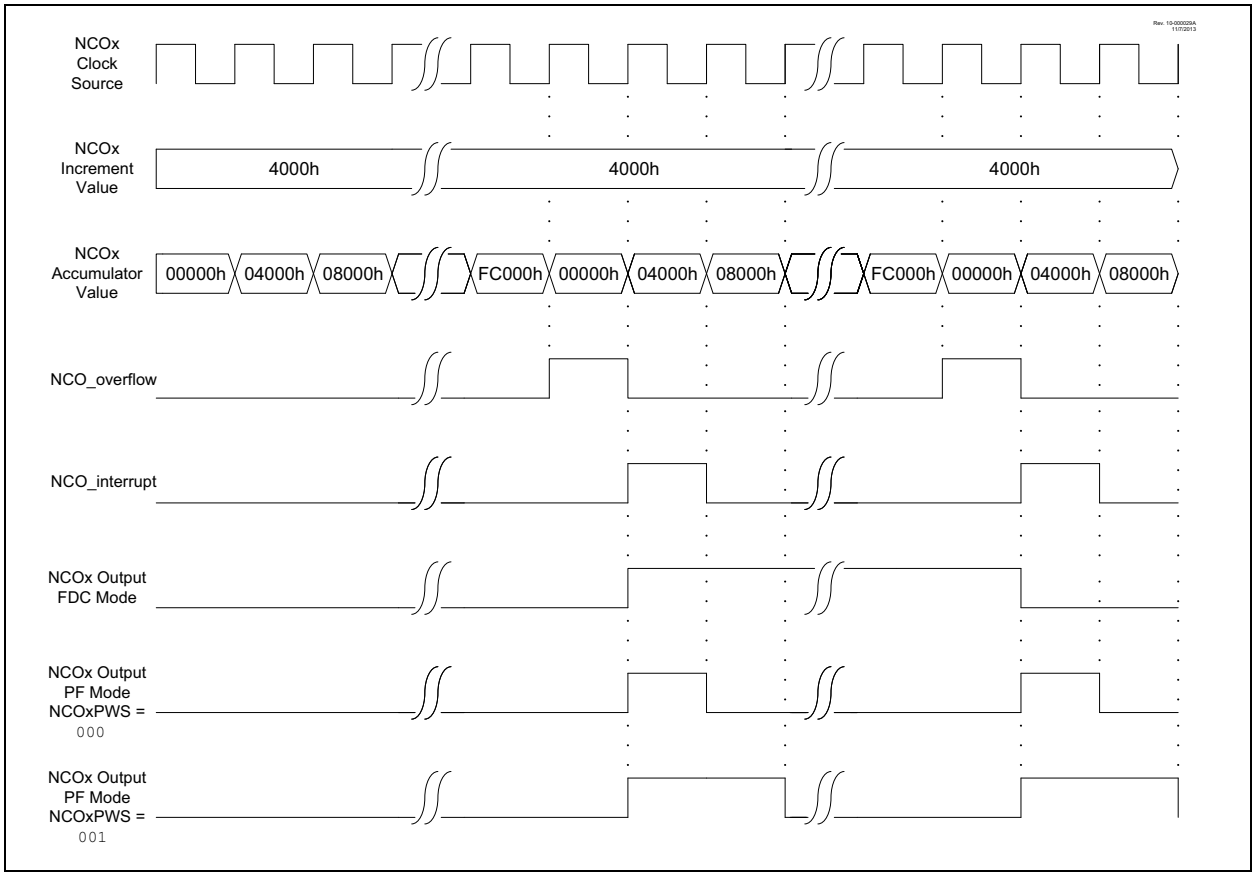
In other words, if the HFINTOSC is simultaneously selected as system clock and CWG clock, when the CWG is enabled and the input source is active, then the CPU will go idle during Sleep, but the HFINTOSC will remain active and the CWG will continue to operate. This will have a direct effect on the Sleep mode current.

26.13 Configuring the CWG

1. Ensure that the TRIS control bits corresponding to CWG outputs are set so that all are configured as inputs, ensuring that the outputs are inactive during setup. External hardware should ensure that pin levels are held to safe levels.
2. Clear the EN bit, if not already cleared.
3. Configure the MODE<2:0> bits of the CWGxCON0 register to set the output operating mode.
4. Configure the POLy bits of the CWGxCON1 register to set the output polarities.
5. Configure the ISM<4:0> bits of the CWGxISM register to select the data input source.
6. If a steering mode is selected, configure the STRx bits to select the desired output on the CWG outputs.
7. Configure the LSBD<1:0> and LSAC<1:0> bits of the CWGxASD0 register to select the auto-shutdown output override states (this is necessary even if not using auto-shutdown because start-up will be from a shutdown state).
8. If auto-restart is desired, set the REN bit of CWGxAS0.
9. If auto-shutdown is desired, configure the ASxE bits of the CWGxAS1 register to select the shutdown source.
10. Set the desired rising and falling dead-band times with the CWGxDBR and CWGxDBF registers.
11. Select the clock source in the CWGxCLKCON register.
12. Set the EN bit to enable the module.
13. Clear the TRIS bits that correspond to the CWG outputs to set them as outputs.

If auto-restart is to be used, set the REN bit and the SHUTDOWN bit will be cleared automatically. Otherwise, clear the SHUTDOWN bit in software to start the CWG.

FIGURE 28-2: FDC OUTPUT MODE OPERATION DIAGRAM



33.1 I²C Features

- Inter-Integrated Circuit (I²C) interface supports the following modes in hardware:
  - Master mode
  - Slave mode with byte NACKing
  - Multi-Master mode
- Dedicated Address, Receive and Transmit buffers
- Up to four Slave addresses matching
- General Call address matching
- 7-bit and 10-bit addressing with masking
- Start, Restart, Stop, Address, Write, and ACK Interrupts
- Clock Stretching hardware for:
  - RX Buffer Full
  - TX Buffer Empty
  - After Address, Write, and ACK
- Bus Collision Detection with arbitration
- Bus Timeout Detection
- SDA hold time selection
- I²C, SMBus 2.0, and SMBus 3.0 input level selections

33.2 I²C Module Overview

The I²C module provides a synchronous interface between the microcontroller and other I²C-compatible devices using the two-wire I²C serial bus. Devices communicate in a master/slave environment. The I²C bus specifies two signal connections:

- Serial Clock (SCL)
- Serial Data (SDA)

Both the SCL and SDA connections are bidirectional open-drain lines, each requiring pull-up resistors to the supply voltage. Pulling the line to ground is considered a logical zero and letting the line float is considered a logical one. Every transaction on the I²C bus has to be initiated by the Master.

Figure 33-2 shows a typical connection between a master and more than one slave.

FIGURE 33-2: I²C MASTER/SLAVE CONNECTIONS

I2CxADR3	ADR14	ADR13	ADR12	ADR11	ADR10	ADR9	ADR8	—	592
I2CxADB0	ADB7	ADB6	ADB5	ADB4	ADB3	ADB2	ADB1	ADB0	593
I2CxADB1	ADB7	ADB6	ADB5	ADB4	ADB3	ADB2	ADB1	ADB0	594

Legend: — = unimplemented, read as '0'. Shaded cells are unused by the I²C module.

INCF **Increment f**

Syntax: INCF f {,d {,a}}

Operands: $0 \le f \le 255$
$d \in [0,1]$
$a \in [0,1]$

Operation: (f) + 1 → dest

Status Affected: C, DC, N, OV, Z

Encoding:

0010	10da	ffff	ffff

Description: The contents of register 'f' are incremented. If 'd' is '0', the result is placed in W. If 'd' is '1', the result is placed back in register 'f' (default).
If 'a' is '0', the Access Bank is selected. If 'a' is '1', the BSR is used to select the GPR bank.
If 'a' is '0' and the extended instruction set is enabled, this instruction operates in Indexed Literal Offset Addressing mode whenever f ≤ 95 (5Fh). See **Section 41.2.3 "Byte-Oriented and Bit-Oriented Instructions in Indexed Literal Offset Mode"** for details.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process Data	Write to destination

Example: `INCF CNT, 1, 0`

Before Instruction
CNT = FFh
Z = 0
C = ?
DC = ?
After Instruction
CNT = 00h
Z = 1
C = 1
DC = 1

INCFSZ **Increment f, skip if 0**

Syntax: INCFSZ f {,d {,a}}

Operands: $0 \le f \le 255$
$d \in [0,1]$
$a \in [0,1]$

Operation: (f) + 1 → dest,
skip if result = 0

Status Affected: None

Encoding:

0011	11da	ffff	ffff

Description: The contents of register 'f' are incremented. If 'd' is '0', the result is placed in W. If 'd' is '1', the result is placed back in register 'f' (default).
If the result is '0', the next instruction, which is already fetched, is discarded and a NOP is executed instead, making it a 2-cycle instruction.
If 'a' is '0', the Access Bank is selected. If 'a' is '1', the BSR is used to select the GPR bank.
If 'a' is '0' and the extended instruction set is enabled, this instruction operates in Indexed Literal Offset Addressing mode whenever f ≤ 95 (5Fh). See **Section 41.2.3 "Byte-Oriented and Bit-Oriented Instructions in Indexed Literal Offset Mode"** for details.

Words: 1

Cycles: 1(2)
Note: 3 cycles if skip and followed by a 2-word instruction.

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process Data	Write to destination

If skip:

Q1	Q2	Q3	Q4
No operation	No operation	No operation	No operation

If skip and followed by 2-word instruction:

Q1	Q2	Q3	Q4
No operation	No operation	No operation	No operation
No operation	No operation	No operation	No operation

Example:
```
HERE    INCFSZ  CNT, 1, 0
NZERO   :
ZERO    :
```

Before Instruction
PC = Address (HERE)
After Instruction
CNT = CNT + 1
If CNT = 0;
PC = Address (ZERO)
If CNT ≠ 0;
PC = Address (NZERO)

41.2.2 EXTENDED INSTRUCTION SET

ADDULNK — Add Literal to FSR2 and Return

Syntax:	ADDULNK k
Operands:	$0 \le k \le 63$
Operation:	FSR2 + k → FSR2, (TOS) → PC
Status Affected:	None
Encoding:	1110 | 1000 | 11kk | kkkk
Description:	The 6-bit literal 'k' is added to the contents of FSR2. A RETURN is then executed by loading the PC with the TOS. The instruction takes two cycles to execute; a NOP is performed during the second cycle. This may be thought of as a special case of the ADDFSR instruction, where f = 3 (binary '11'); it operates only on FSR2.
Words:	1
Cycles:	2

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read literal 'k'	Process Data	Write to FSR
No Operation	No Operation	No Operation	No Operation

Example: ADDULNK 23h

Before Instruction
FSR2 = 03FFh
PC = 0100h

After Instruction
FSR2 = 0422h
PC = (TOS)

Note: All PIC18 instructions may take an optional label argument preceding the instruction mnemonic for use in symbolic addressing. If a label is used, the instruction syntax then becomes: {label} instruction argument(s).

TABLE 44-9: EXTERNAL CLOCK/OSCILLATOR TIMING REQUIREMENTS (CONTINUED)

Standard Operating Conditions (unless otherwise stated)							
Param No.	**Sym.**	**Characteristic**	**Min.**	**Typ†**	**Max.**	**Units**	**Conditions**
OS21	F_{CY}	Instruction Frequency	—	FOSC/4	—	MHz	
OS22	T_{CY}	Instruction Period	62.5	$1/F_{CY}$	—	ns	

* These parameters are characterized but not tested.

† Data in "Typ" column is at 3.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: Instruction cycle period (TCY) equals four times the input oscillator time base period. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at "min" values with an external clock applied to OSC1 pin. When an external clock input is used, the "max" cycle time limit is "DC" (no clock) for all devices.

2: The system clock frequency (FOSC) is selected by the "main clock switch controls" as described in **Section 10.0 "Power-Saving Operation Modes"**.

3: The system clock frequency (FOSC) must meet the voltage requirements defined in the **Section 44.2 "Standard Operating Conditions"**.

4: LP, XT and HS oscillator modes require an appropriate crystal or resonator to be connected to the device. For clocking the device with the external square wave, one of the EC mode selections must be used.
