E·XFL

XMOS - XS1-L6A-64-LQ64-I5 Datasheet

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

Details

Product Status	Active
Core Processor	XCore
Core Size	32-Bit 6-Core
Speed	500MIPS
Connectivity	Configurable
Peripherals	-
Number of I/O	36
Program Memory Size	64KB (16K x 32)
Program Memory Type	SRAM
EEPROM Size	-
RAM Size	-
Voltage - Supply (Vcc/Vdd)	0.95V ~ 3.6V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP Exposed Pad
Supplier Device Package	64-LQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/xmos/xs1-l6a-64-lq64-i5

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

1 xCORE Multicore Microcontrollers

The XS1-L Series is a comprehensive range of 32-bit multicore microcontrollers that brings the low latency and timing determinism of the xCORE architecture to mainstream embedded applications. Unlike conventional microcontrollers, xCORE multicore microcontrollers execute multiple real-time tasks simultaneously and communicate between tasks using a high speed network. Because xCORE multicore microcontrollers are completely deterministic, you can write software to implement functions that traditionally require dedicated hardware.

Figure 1: XS1-L Series: 4-16 core devices

Key features of the XS1-L6A-64-LQ64 include:

- Tiles: Devices consist of one or more xCORE tiles. Each tile contains between four and eight 32-bit xCOREs with highly integrated I/O and on-chip memory.
- Logical cores Each logical core can execute tasks such as computational code, DSP code, control software (including logic decisions and executing a state machine) or software that handles I/O. Section 5.1
- xTIME scheduler The xTIME scheduler performs functions similar to an RTOS, in hardware. It services and synchronizes events in a core, so there is no requirement for interrupt handler routines. The xTIME scheduler triggers cores on events generated by hardware resources such as the I/O pins, communication channels and timers. Once triggered, a core runs independently and concurrently to other cores, until it pauses to wait for more events. Section 5.2

3 Pin Configuration

-XMOS

- 1. Allocate channel-end 0.
- 2. Input a word on channel-end 0. It will use this word as a channel to acknowledge the boot. Provide the null-channel-end 0x0000FF02 if no acknowledgment is required.
- 3. Input the boot image specified above, including the CRC.
- 4. Input an END control token.
- 5. Output an END control token to the channel-end received in step 2.
- 6. Free channel-end 0.
- 7. Jump to the loaded code.

7.3 Boot from OTP

If an xCORE tile is set to use secure boot (see Figure 7), the boot image is read from address 0 of the OTP memory in the tile's security module.

This feature can be used to implement a secure bootloader which loads an encrypted image from external flash, decrypts and CRC checks it with the processor, and discontinues the boot process if the decryption or CRC check fails. XMOS provides a default secure bootloader that can be written to the OTP along with secret decryption keys.

Each tile has its own individual OTP memory, and hence some tiles can be booted from OTP while others are booted from SPI or the channel interface. This enables systems to be partially programmed, dedicating one or more tiles to perform a particular function, leaving the other tiles user-programmable.

7.4 Security register

The security register enables security features on the xCORE tile. The features shown in Figure 10 provide a strong level of protection and are sufficient for providing strong IP security.

8 Memory

8.1 OTP

The xCORE Tile integrates 8 KB one-time programmable (OTP) memory along with a security register that configures system wide security features. The OTP holds data in four sectors each containing 512 rows of 32 bits which can be used to implement secure bootloaders and store encryption keys. Data for the security register is loaded from the OTP on power up. All additional data in OTP is copied from the OTP to SRAM and executed first on the processor.

The OTP memory is programmed using three special I/O ports: the OTP address port is a 16-bit port with resource ID 0x100200, the OTP data is written via a 32-bit

10 Board Integration

The device has the following power supply pins:

- ▶ VDD pins for the xCORE Tile
- VDDIO pins for the I/O lines
- ▶ PLL_AVDD pins for the PLL

Several pins of each type are provided to minimize the effect of inductance within the package, all of which must be connected. The power supplies must be brought up monotonically and input voltages must not exceed specification at any time.

The VDD supply must ramp from 0V to its final value within 10 ms to ensure correct startup.

The VDDIO supply must ramp to its final value before VDD reaches 0.4 V.

The PLL_AVDD supply should be separated from the other noisier supplies on the board. The PLL requires a very clean power supply, and a low pass filter (for example, a 4.7Ω resistor and 100 nF multi-layer ceramic capacitor) is recommended on this pin.

The following ground pins are provided:

- PLL_AGND for PLL_AVDD
- ► GND for all other supplies

All ground pins must be connected directly to the board ground.

The VDD and VDDIO supplies should be decoupled close to the chip by several 100 nF low inductance multi-layer ceramic capacitors between the supplies and GND (for example, 4×100 nF 0402 low inductance MLCCs per supply rail). The ground side of the decoupling capacitors should have as short a path back to the GND pins as possible. A bulk decoupling capacitor of at least 10 uF should be placed on each of these supplies.

RST_N is an active-low asynchronous-assertion global reset signal. Following a reset, the PLL re-establishes lock after which the device boots up according to the boot mode (*see* §7). RST_N and must be asserted low during and after power up for 100 ns.

10.1 Land patterns and solder stencils

The land pattern recommendations in this document are based on a RoHS compliant process and derived, where possible, from the nominal *Generic Requirements for Surface Mount Design and Land Pattern Standards* IPC-7351B specifications. This standard aims to achieve desired targets of heel, toe and side fillets for solderjoints.

-XMOS-

Solder paste and ground via recommendations are based on our engineering and development kit board production. They have been found to work and optimized as appropriate to achieve a high yield. The size, type and number of vias used in the center pad affects how much solder wicks down the vias during reflow. This in turn, along with solder paster coverage, affects the final assembled package height. These factors should be taken into account during design and manufacturing of the PCB.

The following land patterns and solder paste contains recommendations. Final land pattern and solder paste decisions are the responsibility of the customer. These should be tuned during manufacture to suit the manufacturing process.

The package is a 64 pin Low profile Quad Flat Pack package with exposed heat slug on a 0.5mm pitch. An example land pattern is shown in Figure 14.

Figure 14: Example land pattern

> For the 64 pin LQFP package, a 3x3 array of squares for solder paste is recommended as shown in Figure 15. This gives a paste level of 48%.

11.4 Reset Timing

Figure 19: Reset timing

Symbol	Parameters	MIN	ТҮР	MAX	UNITS	Notes
T(RST)	Reset pulse width	5			μs	
T(INIT)	Initialization time			150	μs	А

A Shows the time taken to start booting after RST_N has gone high.

11.5 Power Consumption

Symbol	Parameter	MIN	ТҮР	MAX	UNITS	Notes
I(DDCQ)	Quiescent VDD current		14		mA	A, B, C
PD	Tile power dissipation		450		µW/MIPS	A, D, E, F
IDD	Active VDD current (Speed Grade 4)		160	300	mA	A, G
	Active VDD current (Speed Grade 5)		200	375	mA	А, Н
I(ADDPLL)	PLL_AVDD current			7	mA	I

Figure 20: xCORE Tile currents

A Use for budgetary purposes only.

B Assumes typical tile and I/O voltages with no switching activity.

C Includes PLL current.

D Assumes typical tile and I/O voltages with nominal switching activity.

E Assumes 1 MHz = 1 MIPS.

F PD(TYP) value is the usage power consumption under typical operating conditions.

-XM()S

G Measurement conditions: VDD = 1.0 V, VDDIO = 3.3 V, 25 °C, 400 MHz, average device resource usage.

H Measurement conditions: VDD = 1.0 V, VDDIO = 3.3 V, 25 °C, 500 MHz, average device resource usage.

I PLL_AVDD = 1.0 V

The tile power consumption of the device is highly application dependent and should be used for budgetary purposes only.

More detailed power analysis can be found in the XS1-L Power Consumption document, X2999.

11.6 Clock

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
f	Frequency	4.22	20	100	MHz	
SR	Slew rate	0.10			V/ns	
TJ(LT)	Long term jitter (pk-pk)			2	%	А
f(MAX)	Processor clock frequency (Speed Grade 4)			400	MHz	В
	Processor clock frequency (Speed Grade 5)			500	MHz	В

Figure 21: Clock

A Percentage of CLK period.

B Assumes typical tile and I/O voltages with nominal activity.

Further details can be found in the XS1-L Clock Frequency Control document, X1433.

11.7 xCORE Tile I/O AC Characteristics

	Symbol	Parameter	MIN	ТҮР	MAX	UNITS	Notes
=:	T(XOVALID)	Input data valid window	8			ns	
Figure 22:	T(XOINVALID)	Output data invalid window	9			ns	
acteristics	T(XIFMAX)	Rate at which data can be sampled with respect to an external clock			60	MHz	

The input valid window parameter relates to the capability of the device to capture data input to the chip with respect to an external clock source. It is calculated as the sum of the input setup time and input hold time with respect to the external clock as measured at the pins. The output invalid window specifies the time for which an output is invalid with respect to the external clock. Note that these parameters are specified as a window rather than absolute numbers since the device provides functionality to delay the incoming clock with respect to the incoming data.

Information on interfacing to high-speed synchronous interfaces can be found in the XS1 Port I/O Timing document, X5821.

11.8 xConnect Link Performance

	Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
	B(2blinkP)	2b link bandwidth (packetized)			87	MBit/s	А, В
Figure 23:	B(5blinkP)	5b link bandwidth (packetized)			217	MBit/s	А, В
Link	B(2blinkS)	2b link bandwidth (streaming)			100	MBit/s	В
performance	B(5blinkS)	5b link bandwidth (streaming)			250	MBit/s	В

A Assumes 32-byte packet in 3-byte header mode. Actual performance depends on size of the header and payload.

B 7.5 ns symbol time.

12.1 Part Marking

13 Ordering Information

	Product Code	Marking	Qualification	Speed Grade

Figure 26:	XS1-L6A-64-LQ64-C5	6L6C5	Commercial	500 MIPS
Orderable	XS1-L6A-64-LQ64-I4	6L6I4	Industrial	400 MIPS
part numbers	XS1-L6A-64-LQ64-I5	6L6I5	Industrial	500 MIPS

-XMOS

The response to a write message comprises either control tokens 3 and 1 (for success), or control tokens 4 and 1 (for failure).

A read message comprises the following:

control-token	24-bit response	16-bit	control-token
193	channel-end identifier	register number	1

The response to the read message comprises either control token 3, 32-bit of data, and control-token 1 (for success), or control tokens 4 and 1 (for failure).

A.3 Accessing node configuration

Node configuration registers can be accessed through the interconnect using the functions write_node_config_reg(device, ...) and read_node_config_reg(device, ...), where device is the name of the node. These functions implement the protocols described below.

Instead of using the functions above, a channel-end can be allocated to communicate with the node configuration registers. The destination of the channel-end should be set to 0xnnnnC30C where nnnn is the node-identifier.

A write message comprises the following:

control-token	24-bit response	16-bit	32-bit	control-token
192	channel-end identifier	register number	data	1

The response to a write message comprises either control tokens 3 and 1 (for success), or control tokens 4 and 1 (for failure).

A read message comprises the following:

 $-X \wedge ()S$

The response to a read message comprises either control token 3, 32-bit of data, and control-token 1 (for success), or control tokens 4 and 1 (for failure).

B Processor Status Configuration

The processor status control registers can be accessed directly by the processor using processor status reads and writes (use getps(reg) and setps(reg,value) for reads and writes).

Number	Perm	Description
0x00	RW	RAM base address
0x01	RW	Vector base address
0x02	RW	xCORE Tile control
0x03	RO	xCORE Tile boot status

-XMOS[®]

Figure 28: Summary

XS1-L6A-64-LQ64

B.8 Ring Oscillator Value: 0x08

This register contains the current count of the xCORE Tile Wire ring oscillator. This value is not reset on a system reset.

0x08: Ring Oscillator Value

Bits	Perm	Init	Description
31:16	RO	-	Reserved
15:0	RO	-	Ring oscillator counter data.

B.9 Ring Oscillator Value: 0x09

This register contains the current count of the Peripheral Cell ring oscillator. This value is not reset on a system reset.

0x09 Ring Oscillator Value

:	Bits	Perm	Init	Description	
-	31:16	RO	-	Reserved	
2	15:0	RO	-	Ring oscillator counter data.	

B.10 Ring Oscillator Value: 0x0A

This register contains the current count of the Peripheral Wire ring oscillator. This value is not reset on a system reset.

0x0A: Ring Oscillator Value

A:	Bits	Perm	Init	Description
9 Dr	31:16	RO	-	Reserved
e	15:0	RO	-	Ring oscillator counter data.

B.11 Debug SSR: 0x10

This register contains the value of the SSR register when the debugger was called.

0x10:	Bits	Perm	Init	Description
Debug SSR	31:0	RO	-	Reserved

B.12 Debug SPC: 0x11

This register contains the value of the SPC register when the debugger was called.

Bits	Perm	Init	Description
31:18	RO	-	Reserved
17:16	DRW		If the debug interrupt was caused by a hardware breakpoint or hardware watchpoint, this field contains the number of the breakpoint or watchpoint. If multiple breakpoints or watch- points trigger at once, the lowest number is taken.
15:8	DRW		If the debug interrupt was caused by a logical core, this field contains the number of that core. Otherwise this field is 0.
7:3	RO	-	Reserved
2:0	DRW	0	Indicates the cause of the debug interrupt 1: Host initiated a debug interrupt through JTAG 2: Program executed a DCALL instruction 3: Instruction breakpoint 4: Data watch point 5: Resource watch point

0x15: Debug interrupt type

B.17 Debug interrupt data: 0x16

On a data watchpoint, this register contains the effective address of the memory operation that triggered the debugger. On a resource watchpoint, it countains the resource identifier.

0x16 Debug interrupt data

ebug data	Bits	Perm	Init	Description
	31:0	DRW		Value.

B.18 Debug core control: 0x18

This register enables the debugger to temporarily disable logical cores. When returning from the debug interrupts, the cores set in this register will not execute. This enables single stepping to be implemented.

0x18: Debug core control

Bits	Perm	Init	Description
31:8	RO	-	Reserved
7:0	DRW		1-hot vector defining which logical cores are stopped when not in debug mode. Every bit which is set prevents the respective logical core from running.

-XMOS

B.19 Debug scratch: 0x20 .. 0x27

A set of registers used by the debug ROM to communicate with an external debugger, for example over JTAG. This is the same set of registers as the Debug Scratch registers in the xCORE tile configuration.

0x20 .. 0x27: Debug scratch

bug atch	Bits	Perm	Init	Description	
	31:0	DRW		Value.	

B.20 Instruction breakpoint address: 0x30 .. 0x33

This register contains the address of the instruction breakpoint. If the PC matches this address, then a debug interrupt will be taken. There are four instruction breakpoints that are controlled individually.

0x30 .. 0x33: Instruction breakpoint address

tion				
oint	Bits	Perm	Init	Description
ress	31:0	DRW		Value.

B.21 Instruction breakpoint control: 0x40 .. 0x43

This register controls which logical cores may take an instruction breakpoint, and under which condition.

Bits	Perm	Init	Description	
31:24	RO	-	Reserved	
23:16	DRW	0	A bit for each logical core in the tile allowing the breakpoint to be enabled individually for each logical core.	
15:2	RO	-	Reserved	
1	DRW	0	Set to 1 to cause an instruction breakpoint if the PC is not equal to the breakpoint address. By default, the breakpoint is triggered when the PC is equal to the breakpoint address.	
0	DRW	0	When 1 the instruction breakpoint is enabled.	

0x40 .. 0x43: Instruction breakpoint control

B.22 Data watchpoint address 1: 0x50 ... 0x53

This set of registers contains the first address for the four data watchpoints.

XMOS

0x80 .. 0x83: Resources breakpoint mask

irces point nask	Bits	Perm	Init	Description		
	31:0	DRW		Value.		

B.26 Resources breakpoint value: 0x90 .. 0x93

This set of registers contains the value for the four resource watchpoints.

0x90 .. 0x93: Resources breakpoint value

es int	Bits	Perm	Init	Description
ue	31:0	DRW		Value.

B.27 Resources breakpoint control register: 0x9C .. 0x9F

This set of registers controls each of the four resource watchpoints.

	Bits	Perm	Init	Description
	31:24	RO	-	Reserved
	23:16	DRW	0	A bit for each logical core in the tile allowing the breakpoint to be enabled individually for each logical core.
	15:2	RO	-	Reserved
0x9C 0x9F: Resources breakpoint control	1	DRW	0	By default, resource watchpoints trigger when the resource id masked with the set Mask equals the Value. If set to 1, resource watchpoints trigger when the resource id masked with the set Mask is not equal to the Value.
register	0	DRW	0	When 1 the instruction breakpoint is enabled.

-XMOS°

XS1-L6A-64-LQ64

Bits	Perm	Init	Description
31:26	RO	-	Reserved
25:24	RO		00 - ChannelEnd, 01 - ERROR, 10 - PSCTL, 11 - Idle.
23:16	RO		Based on SRC_TARGET_TYPE value, it represents channelEnd ID or Idle status.
15:6	RO	-	Reserved
5:4	RO		Two-bit network identifier
3	RO	-	Reserved
2	RO		1 when the current packet is considered junk and will be thrown away.
1	RO	0	Set to 1 if the switch is routing data into the link, and if a route exists from another link.
0	RO	0	Set to 1 if the link is routing data into the switch, and if a route is created to another link on the switch.

0x10 .. 0x13: PLink status

C.9 Debug scratch: 0x20 .. 0x27

A set of registers used by the debug ROM to communicate with an external debugger, for example over the switch. This is the same set of registers as the Debug Scratch registers in the processor status.

0x20 .. 0x27 Debug scratch

Debug	Bits	Perm	Init	Description
scratch	31:0	CRW		Value.

C.10 PC of logical core 0: 0x40

Value of the PC of logical core 0.

0x40 PC of logical core 0

al	Bits	Perm	Init	Description
0	31:0	RO		Value.

D Node Configuration

The digital node control registers can be accessed using configuration reads and writes (use write_node_config_reg(device, ...) and read_node_config_reg(device, ...) for reads and writes).

Number	Perm	Description	
0x00	RO	Device identification	
0x01	RO	System switch description	
0x04	RW	Switch configuration	
0x05	RW	Switch node identifier	
0x06	RW	PLL settings	
0x07	RW	System switch clock divider	
0x08	RW	Reference clock	
0x0C	RW	Directions 0-7	
0x0D	RW	Directions 8-15	
0x10	RW	DEBUG_N configuration	
0x1F	RO	Debug source	
0x20 0x27	RW	Link status, direction, and network	
0x40 0x43	RW	PLink status and network	
0x80 0x87	RW	Link configuration and initialization	
0xA0 0xA7	RW	Static link configuration	

Figure 30: Summary

D.1 Device identification: 0x00

This register contains version and revision identifiers and the mode-pins as sampled at boot-time.

	Bits	Perm	Init	Description
	31:24	RO	0x00	Chip identifier.
0×00:	23:16	RO		Sampled values of pins MODE0, MODE1, on reset.
Device	15:8	RO		SSwitch revision.
identification	7:0	RO		SSwitch version.

D.2 System switch description: 0x01

This register specifies the number of processors and links that are connected to this switch.

-XMOS

Bits	Perm	Init	Description	
31:26	RO	-	Reserved	
25:23	RW		OD: Output divider value The initial value depends on pins MODE0 and MODE1.	
22:21	RO	-	Reserved	
20:8	RW		F: Feedback multiplication ratio The initial value depends on pins MODE0 and MODE1.	
7	RO	-	Reserved	
6:0	RW		R: Oscilator input divider value The initial value depends on pins MODE0 and MODE1.	

0x06: PLL settings

D.6 System switch clock divider: 0x07

Sets the ratio of the PLL clock and the switch clock.

0x07 System switch clock divider

7.	Bits	Perm	Init	Description
m.	31:16	RO	-	Reserved
ck er	15:0	RW	0	Switch clock divider. The PLL clock will be divided by this value plus one to derive the switch clock.

D.7 Reference clock: 0x08

Sets the ratio of the PLL clock and the reference clock used by the node.

0x08: Reference clock

Bits	Perm	Init	Description
31:16	RO	-	Reserved
15:0	RW	3	Architecture reference clock divider. The PLL clock will be divided by this value plus one to derive the 100 MHz reference clock.

D.8 Directions 0-7: 0x0C

This register contains eight directions, for packets with a mismatch in bits 7..0 of the node-identifier. The direction in which a packet will be routed is goverened by the most significant mismatching bit.

G JTAG, xSCOPE and Debugging

If you intend to design a board that can be used with the XMOS toolchain and xTAG debugger, you will need an xSYS header on your board. Figure 32 shows a decision diagram which explains what type of xSYS connectivity you need. The three subsections below explain the options in detail.

G.1 No xSYS header

The use of an xSYS header is optional, and may not be required for volume production designs. However, the XMOS toolchain expects the xSYS header; if you do not have an xSYS header then you must provide your own method for writing to flash/OTP and for debugging.

G.2 JTAG-only xSYS header

The xSYS header connects to an xTAG debugger, which has a 20-pin 0.1" female IDC header. The design will hence need a male IDC header. We advise to use a boxed header to guard against incorrect plug-ins. If you use a 90 degree angled header, make sure that pins 2, 4, 6, ..., 20 are along the edge of the PCB.

Connect pins 4, 8, 12, 16, 20 of the xSYS header to ground, and then connect:

- ▶ TDI to pin 5 of the xSYS header
- TMS to pin 7 of the xSYS header
- TCK to pin 9 of the xSYS header
- DEBUG_N to pin 11 of the xSYS header

- ▶ TDO to pin 13 of the xSYS header
- RST_N and TRST_N to pin 15 of the xSYS header
- If MODE2 is configured high, connect MODE2 to pin 3 of the xSYS header. Do not connect to VDDIO.
- If MODE3 is configured high, connect MODE3 to pin 3 of the xSYS header. Do not connect to VDDIO.

The RST_N net should be open-drain, active-low, and have a pull-up to VDDIO.

G.3 Full xSYS header

For a full xSYS header you will need to connect the pins as discussed in Section G.2, and then connect a 2-wire xCONNECT Link to the xSYS header. The links can be found in the Signal description table (Section 4): they are labelled XLA, XLB, etc in the function column. The 2-wire link comprises two inputs and outputs, labelled ${}^{1}_{out}$, ${}^{0}_{out}$, ${}^{0}_{in}$, and ${}^{1}_{in}$. For example, if you choose to use XLB of tile 0 for xSCOPE I/O, you need to connect up XLB¹_{out}, XLB⁰_{out}, XLB⁰_{in}, XLB¹_{in} as follows:

- XLB¹_{out} (X0D16) to pin 6 of the xSYS header with a 33R series resistor close to the device.
- XLB⁰_{out} (X0D17) to pin 10 of the xSYS header with a 33R series resistor close to the device.
- ▶ XLB⁰_{in} (X0D18) to pin 14 of the xSYS header.
- ▶ XLB¹_{in} (X0D19) to pin 18 of the xSYS header.
