
Welcome to E-XFL.COM

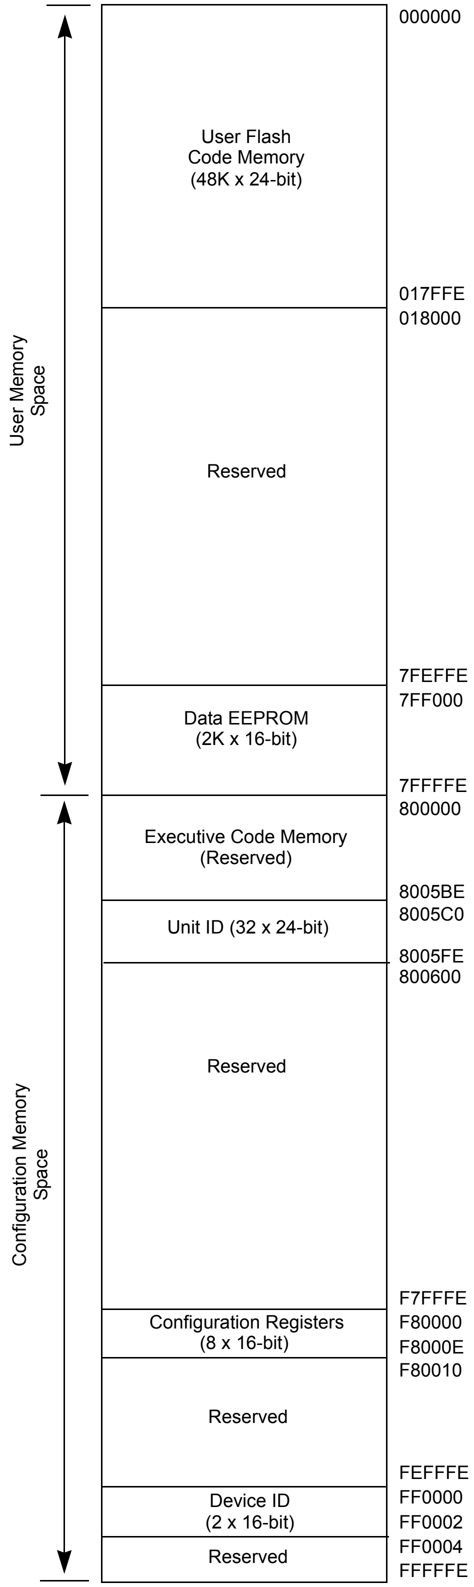
What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	dsPIC
Core Size	16-Bit
Speed	20 MIPS
Connectivity	I²C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	20
Program Memory Size	24KB (8K x 24)
Program Memory Type	FLASH
EEPROM Size	1K x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	2.5V ~ 5.5V
Data Converters	A/D 10x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic30f3013t-20e-so

FIGURE 2-2: PROGRAM MEMORY MAP



Note: The address boundaries for user Flash code memory and data EEPROM are device-dependent.

5.0 DEVICE PROGRAMMING

5.1 Overview of the Programming Process

Once the programming executive has been verified in memory (or loaded if not present), the dsPIC30F can be programmed using the command set shown in Table 5-1. A detailed description for each command is provided in **Section 8.0 "Programming Executive Commands"**.

TABLE 5-1: COMMAND SET SUMMARY

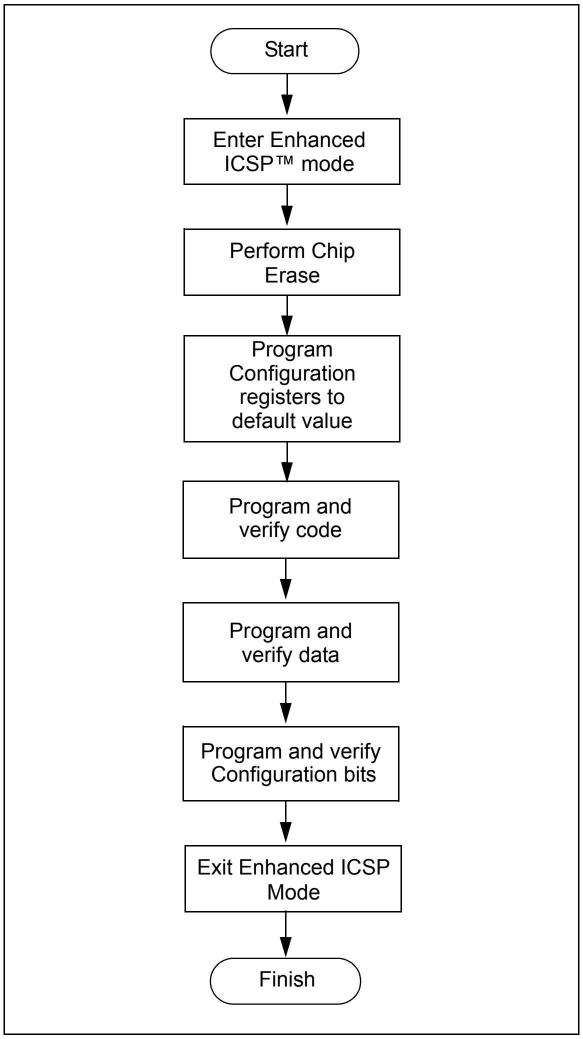
Command	Description
`SCHECK`	Sanity check
`READD`	Read data EEPROM, Configuration registers and device ID
`READP`	Read code memory
`PROGD`	Program one row of data EEPROM and verify
`PROGP`	Program one row of code memory and verify
`PROGC`	Program Configuration bits and verify
`ERASEB`	Bulk Erase, or erase by segment
`ERASED`	Erase data EEPROM
`ERASEP`	Erase code memory
`QBLANK`	Query if the code memory and data EEPROM are blank
`QVER`	Query the software version

A high-level overview of the programming process is illustrated in Figure 5-1. The process begins by entering Enhanced ICSP mode. The chip is then bulk erased, which clears all memory to '`1`' and allows the device to be programmed. The Chip Erase is verified before programming begins. Next, the code memory, data Flash and Configuration bits are programmed. As these memories are programmed, they are each verified to ensure that programming was successful. If no errors are detected, the programming is complete and Enhanced ICSP mode is exited. If any of the verifications fail, the procedure should be repeated, starting from the Chip Erase.

If Advanced Security features are enabled, then individual Segment Erase operations need to be performed, based on user selections (i.e., based on the specific needs of the user application). The specific operations that are used typically depend on the order in which various segments need to be programmed for a given application or system.

Section 5.2 "Entering Enhanced ICSP Mode" through **Section 5.8 "Exiting Enhanced ICSP Mode"** describe the programming process in detail.

FIGURE 5-1: PROGRAMMING FLOW



Start
Enter Enhanced ICSP™ mode
Perform Chip Erase
Program Configuration registers to default value
Program and verify code
Program and verify data
Program and verify Configuration bits
Exit Enhanced ICSP Mode

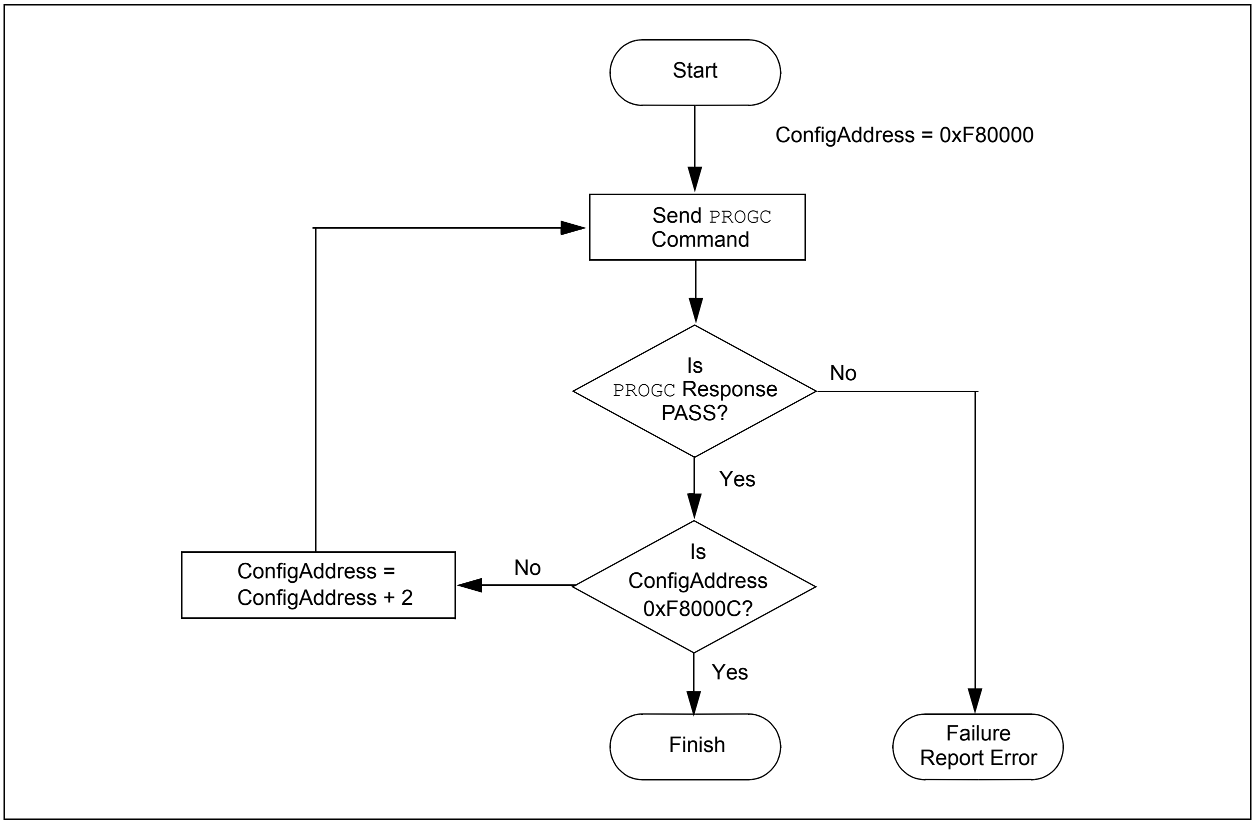
—	All	**Unimplemented (read as '0', write as '0')**

5.8 Exiting Enhanced ICSP Mode

The Enhanced ICSP mode is exited by removing power from the device or bringing $\overline{\text{MCLR}}$ to V_{IL}. When normal user mode is next entered, the program that was stored using Enhanced ICSP will execute.

FIGURE 5-5: CONFIGURATION BIT PROGRAMMING FLOW



8.0 PROGRAMMING EXECUTIVE COMMANDS

8.1 Command Set

The programming executive command set is shown in Table 8-1. This table contains the opcode, mnemonic, length, time out and description for each command. Functional details on each command are provided in the command descriptions (see **Section 8.5 "Command Descriptions"**).

8.2 Command Format

All programming executive commands have a general format consisting of a 16-bit header and any required data for the command (see Figure 8-1). The 16-bit header consists of a 4-bit opcode field, which is used to identify the command, followed by a 12-bit command length field.

FIGURE 8-1: COMMAND FORMAT

15 12	11 0
Opcode	Length
Command Data First Word (if required)	
•	
•	
Command Data Last Word (if required)	

The command opcode must match one of those in the command set. Any command that is received which does not match the list in Table 8-1 will return a "NACK" response (see **Section 9.2.1 "`Opcode` Field"**).

The command length is represented in 16-bit words since the SPI operates in 16-bit mode. The programming executive uses the Command Length field to determine the number of words to read from the SPI port. If the value of this field is incorrect, the command will not be properly received by the programming executive.

8.3 Packed Data Format

When 24-bit instruction words are transferred across the 16-bit SPI interface, they are packed to conserve space using the format shown in Figure 8-2. This format minimizes traffic over the SPI and provides the programming executive with data that is properly aligned for performing table write operations.

FIGURE 8-2: PACKED INSTRUCTION WORD FORMAT

15 8	7 0
lsw1	
MSB2	MSB1
lsw2	

lswx: Least significant 16 bits of instruction word
MSBx: Most Significant Byte of instruction word

> **Note:** When the number of instruction words transferred is odd, MSB2 is zero and lsw2 cannot be transmitted.

8.4 Programming Executive Error Handling

The programming executive will "NACK" all unsupported commands. Additionally, due to the memory constraints of the programming executive, no checking is performed on the data contained in the Programmer command. It is the responsibility of the programmer to command the programming executive with valid command arguments, or the programming operation may fail. Additional information on error handling is provided in **Section 9.2.3 "QE_Code Field"**.

8.5.3 READP COMMAND

15 12	11 8	7 0
Opcode	Length	
N		
Reserved		Addr_MSB
Addr_LS		

Field	Description
Opcode	0x2
Length	0x4
N	Number of 24-bit instructions to read (max of 32768)
Reserved	0x0
Addr_MSB	MSB of 24-bit source address
Addr_LS	LS 16 bits of 24-bit source address

The READP command instructs the programming executive to read N 24-bit words of code memory starting from the 24-bit address specified by Addr_MSB and Addr_LS. This command can only be used to read 24-bit data. All data returned in response to this command uses the packed data format described in **Section 8.3 "Packed Data Format"**.

Expected Response (2 + 3 * N/2 words for N even):
0x1200
2 + 3 * N/2
Least significant program memory word 1
...
Least significant data word N

Expected Response (4 + 3 * (N – 1)/2 words for N odd):
0x1200
4 + 3 * (N – 1)/2
Least significant program memory word 1
...
MSB of program memory word N (zero padded)

Note:	Reading unimplemented memory will cause the programming executive to reset.

8.5.4 PROGD COMMAND

15 12	11 8	7 0
Opcode	Length	
Reserved		Addr_MSB
Addr_LS		
D_1		
D_2		
...		
D_16		

Field	Description
Opcode	0x4
Length	0x13
Reserved	0x0
Addr_MSB	MSB of 24-bit destination address
Addr_LS	LS 16 bits of 24-bit destination address
D_1	16-bit data word 1
D_2	16-bit data word 2
...	16-bit data words 3 through 15
D_16	16-bit data word 16

The PROGD command instructs the programming executive to program one row of data EEPROM. The data to be programmed is specified by the 16 data words (D_1, D_2,..., D_16) and is programmed to the destination address specified by Addr_MSB and Addr_LSB. The destination address should be a multiple of 0x20.

Once the row of data EEPROM has been programmed, the programming executive verifies the programmed data against the data in the command.

Expected Response (2 words):
0x1400
0x0002

Note:	Refer to Table 5-3 for data EEPROM size information.

8.5.5 PROGP COMMAND

15 12	11 8	7 0
Opcode	Length	
Reserved		Addr_MSB
Addr_LS		
D_1		
D_2		
...		
D_N		

Field	Description
Opcode	0x5
Length	0x33
Reserved	0x0
Addr_MSB	MSB of 24-bit destination address
Addr_LS	LS 16 bits of 24-bit destination address
D_1	16-bit data word 1
D_2	16-bit data word 2
...	16-bit data word 3 through 47
D_48	16-bit data word 48

The PROGP command instructs the programming executive to program one row of code memory (32 instruction words) to the specified memory address. Programming begins with the row address specified in the command. The destination address should be a multiple of 0x40.

The data to program to memory, located in command words D_1 through D_48, must be arranged using the packed instruction word format shown in Figure 8-2.

After all data has been programmed to code memory, the programming executive verifies the programmed data against the data in the command.

Expected Response (2 words):
0x1500
0x0002

Note: Refer to Table 5-2 for code memory size information.

8.5.6 PROGC COMMAND

15 12	11 8	7 0
Opcode	Length	
Reserved		Addr_MSB
Addr_LS		
Data		

Field	Description
Opcode	0x6
Length	0x4
Reserved	0x0
Addr_MSB	MSB of 24-bit destination address
Addr_LS	LS 16 bits of 24-bit destination address
Data	Data to program

The PROGC command programs data to the specified Configuration register and verifies the programming. Configuration registers are 16 bits wide, and this command allows one Configuration register to be programmed.

Expected Response (2 words):
0x1600
0x0002

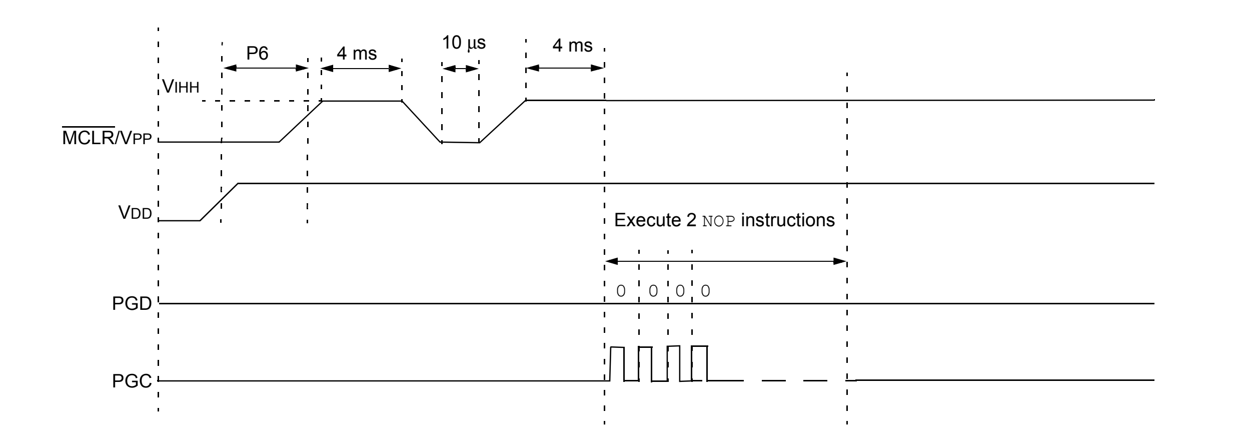
Note: This command can only be used for programming Configuration registers.

11.3 Entering ICSP Mode

The ICSP mode is entered by holding PGC and PGD low, raising $\overline{\text{MCLR}}$/VPP to VIHH (high voltage), and then performing additional steps as illustrated in Figure 11-4.

> **Note 1:** The sequence that places the device into ICSP mode places all unused I/O pins to the high-impedance state.
>
> **2:** Once ICSP mode is entered, the PC is set to 0x0 (the Reset vector).
>
> **3:** Before leaving the Reset vector, execute two `GOTO` instructions, followed by a single `NOP` instruction must be executed.

FIGURE 11-4: ENTERING ICSP™ MODE



11.6 Erasing Program Memory in Low-Voltage Systems

The procedure for erasing program memory (all code memory and data memory) in low-voltage systems (with VDD between 2.5 volts and 4.5 volts) is quite different than the procedure for erasing program memory in normal-voltage systems. Instead of using a Bulk Erase operation, each region of memory must be individually erased by row. Namely, all of the code memory, executive memory and data memory must be erased one row at a time. This procedure is detailed in Table 11-5.

Due to security restrictions, the FBS, FSS and FGS register cannot be erased in low-voltage systems. Once any bits in the FGS register are programmed to '0', they can only be set back to '1' by performing a Bulk Erase in a normal-voltage system. Alternatively, a Segment Erase operation can be performed instead of a Bulk Erase.

Normal-voltage systems can also be used to erase program memory as shown in Table 11-5. However, since this method is more time-consuming and does not clear the code-protect bits, it is not recommended.

> **Note:** Program memory must be erased before writing any data to program memory.

TABLE 11-5: SERIAL INSTRUCTION EXECUTION FOR ERASING PROGRAM MEMORY (EITHER IN LOW-VOLTAGE OR NORMAL-VOLTAGE SYSTEMS)

Command (Binary)	Data (Hexadecimal)	Description
Step 1: Exit the Reset vector.		
0000 0000 0000	040100 040100 000000	GOTO 0x100 GOTO 0x100 NOP
Step 2: Initialize NVMADR and NVMADRU to erase code memory and initialize W7 for row address updates.		
0000 0000 0000 0000	EB0300 883B16 883B26 200407	CLR W6 MOV W6, NVMADR MOV W6, NVMADRU MOV #0x40, W7
Step 3: Set NVMCON to erase 1 row of code memory.		
0000 0000	24071A 883B0A	MOV #0x4071, W10 MOV W10, NVMCON
Step 4: Unlock the NVMCON to erase 1 row of code memory.		
0000 0000 0000 0000	200558 883B38 200AA9 883B39	MOV #0x55, W8 MOV W8, NVMKEY MOV #0xAA, W9 MOV W9, NVMKEY
Step 5: Initiate the erase cycle.		
0000 0000 0000 — 0000 0000 0000 0000 0000	A8E761 000000 000000 — 000000 000000 A9E761 000000 000000	BSET NVMCON, #WR NOP NOP Externally time 'P13a' ms (see **Section 13.0 "AC/DC Characteristics and Timing Requirements"**) NOP NOP BCLR NVMCON, #WR NOP NOP

11.8 Writing Code Memory

The procedure for writing code memory is similar to the procedure for clearing the Configuration registers, except that 32 instruction words are programmed at a time. To facilitate this operation, working registers W0:W5 are used as temporary holding registers for the data to be programmed.

Table 11-8 shows the ICSP programming details, including the serial pattern with the ICSP command code, which must be transmitted Least Significant bit first using the PGC and PGD pins (see Figure 11-2). In Step 1, the Reset vector is exited. In Step 2, the NVMCON register is initialized for single-panel programming of code memory. In Step 3, the 24-bit starting destination address for programming is loaded into the TBLPAG register and W7 register. The upper byte of the starting destination address is stored to TBLPAG, while the lower 16 bits of the destination address are stored to W7.

To minimize the programming time, the same packed instruction format that the programming executive uses is utilized (Figure 8-2). In Step 4, four packed instruction words are stored to working registers W0:W5 using the `MOV` instruction and the read pointer W6 is initialized. The contents of W0:W5 holding the packed instruction word data is shown in Figure 11-4.

In Step 5, eight `TBLWT` instructions are used to copy the data from W0:W5 to the write latches of code memory. Since code memory is programmed 32 instruction words at a time, Steps 4 and 5 are repeated eight times to load all the write latches (Step 6).

After the write latches are loaded, programming is initiated by writing to the NVMKEY and NVMCON registers in Steps 7 and 8. In Step 9, the internal PC is reset to 0x100. This is a precautionary measure to prevent the PC from incrementing into unimplemented memory when large devices are being programmed. Lastly, in Step 10, Steps 2-9 are repeated until all of code memory is programmed.

FIGURE 11-5: PACKED INSTRUCTION WORDS IN W0:W5

`0000`	`000000`	`NOP`
`0000`	`A9E761`	`BCLR NVMCON, #WR`
`0000`	`000000`	`NOP`
`0000`	`000000`	`NOP`
Step 9: Reset device internal PC.		
`0000`	`040100`	`GOTO 0x100`
`0000`	`000000`	`NOP`
Step 10: Repeat steps 2-9 until all data memory is programmed.		

11.10 Reading Code Memory

Reading from code memory is performed by executing a series of TBLRD instructions and clocking out the data using the REGOUT command. To ensure efficient execution and facilitate verification on the programmer, four instruction words are read from the device at a time.

Table 11-10 shows the ICSP programming details for reading code memory. In Step 1, the Reset vector is exited. In Step 2, the 24-bit starting source address for reading is loaded into the TBLPAG and W6 registers. The upper byte of the starting source address is stored to TBLPAG, while the lower 16 bits of the source address are stored to W6.

To minimize the reading time, the packed instruction word format that was utilized for writing is also used for reading (see Figure 11-5). In Step 3, the write pointer W7 is initialized, and four instruction words are read from code memory and stored to working registers W0:W5. In Step 4, the four instruction words are clocked out of the device from the VISI register using the REGOUT command. In Step 5, the internal PC is reset to 0x100, as a precautionary measure, to prevent the PC from incrementing into unimplemented memory when large devices are being read. Lastly, in Step 6, Steps 3-5 are repeated until the desired amount of code memory is read.

TABLE 11-10: SERIAL INSTRUCTION EXECUTION FOR READING CODE MEMORY

Command (Binary)	Data (Hexadecimal)	Description
Step 1: Exit the Reset vector.		
0000	040100	GOTO 0x100
0000	040100	GOTO 0x100
0000	000000	NOP
Step 2: Initialize TBLPAG and the read pointer (W6) for TBLRD instruction.		
0000	200xx0	MOV #<SourceAddress23:16>, W0
0000	880190	MOV W0, TBLPAG
0000	2xxxx6	MOV #<SourceAddress15:0>, W6
Step 3: Initialize the write pointer (W7) and store the next four locations of code memory to W0:W5.

11.12 Reading Data Memory

The procedure for reading data memory is similar to that of reading code memory, except that 16-bit data words are read instead of 24-bit words. Since less data is read in each operation, only working registers W0:W3 are used as temporary holding registers for the data to be read.

Table 11-12 shows the ICSP programming details for reading data memory. Note that the TBLPAG register is hard-coded to 0x7F (the upper byte address of all locations of data memory).

TABLE 11-12: SERIAL INSTRUCTION EXECUTION FOR READING DATA MEMORY

Command (Binary)	Data (Hexadecimal)	Description
Step 1: Exit the Reset vector.		
`0000`	`040100`	`GOTO 0x100`
`0000`	`040100`	`GOTO 0x100`
`0000`	`000000`	`NOP`
Step 2: Initialize TBLPAG and the read pointer (W6) for `TBLRD` instruction.		
`0000`	`2007F0`	`MOV     #0x7F, W0`
`0000`	`880190`	`MOV     W0, TBLPAG`
`0000`	`2xxxx6`	`MOV     #<SourceAddress15:0>, W6`
Step 3: Initialize the write pointer (W7) and store the next four locations of code memory to W0:W5.		
`0000`	`EB0380`	`CLR     W7`
`0000`	`000000`	`NOP`
`0000`	`BA1BB6`	`TBLRDL  [W6++], [W7++]`
`0000`	`000000`	`NOP`
`0000`	`000000`	`NOP`
`0000`	`BA1BB6`	`TBLRDL  [W6++], [W7++]`
`0000`	`000000`	`NOP`
`0000`	`000000`	`NOP`
`0000`	`BA1BB6`	`TBLRDL  [W6++], [W7++]`
`0000`	`000000`	`NOP`
`0000`	`000000`	`NOP`
`0000`	`BA1BB6`	`TBLRDL  [W6++], [W7++]`
`0000`	`000000`	`NOP`
`0000`	`000000`	`NOP`
Step 4: Output W0:W5 using the VISI register and REGOUT command.		
`0000`	`883C20`	`MOV     W0, VISI`
`0000`	`000000`	`NOP`
`0001`	`<VISI>`	`Clock out contents of VISI register`
`0000`	`000000`	`NOP`
`0000`	`883C21`	`MOV     W1, VISI`
`0000`	`000000`	`NOP`
`0001`	`<VISI>`	`Clock out contents of VISI register`
`0000`	`000000`	`NOP`
`0000`	`883C22`	`MOV     W2, VISI`
`0000`	`000000`	`NOP`
`0001`	`<VISI>`	`Clock out contents of VISI register`
`0000`	`000000`	`NOP`
`0000`	`883C23`	`MOV     W3, VISI`
`0000`	`000000`	`NOP`
`0001`	`<VISI>`	`Clock out contents of VISI register`
`0000`	`000000`	`NOP`
Step 5: Reset device internal PC.		
`0000`	`040100`	`GOTO 0x100`
`0000`	`000000`	`NOP`
Step 6: Repeat steps 3-5 until all desired data memory is read.		

TABLE 12-1: PROGRAMMING THE PROGRAMMING EXECUTIVE (CONTINUED)

Command (Binary)	Data (Hexadecimal)	Description
Step 8: Set the read pointer (W6) and load the (next four write) latches.		
0000	EB0300	CLR W6
0000	000000	NOP
0000	BB0BB6	TBLWTL [W6++], [W7]
0000	000000	NOP
0000	000000	NOP
0000	BBDBB6	TBLWTH.B [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BBEBB6	TBLWTH.B [W6++], [++W7]
0000	000000	NOP
0000	000000	NOP
0000	BB1BB6	TBLWTL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BB0BB6	TBLWTL [W6++], [W7]
0000	000000	NOP
0000	000000	NOP
0000	BBDBB6	TBLWTH.B [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BBEBB6	TBLWTH.B [W6++], [++W7]
0000	000000	NOP
0000	000000	NOP
0000	BB1BB6	TBLWTL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
Step 9: Repeat Steps 7-8 eight times to load the write latches for the 32 instructions.		
Step 10: Unlock the NVMCON for programming.		
0000	200558	MOV #0x55, W8
0000	883B38	MOV W8, NVMKEY
0000	200AA9	MOV #0xAA, W9
0000	883B39	MOV W9, NVMKEY
Step 11: Initiate the programming cycle.		
0000	A8E761	BSET NVMCON, #15
0000	000000	NOP
0000	000000	NOP
—	—	Externally time ‘P12a’ ms (see **Section 13.0 “AC/DC Characteristics and Timing Requirements”**)
0000	000000	NOP
0000	000000	NOP
0000	A9E761	BCLR NVMCON, #15
0000	000000	NOP
0000	000000	NOP
Step 12: Reset the device internal PC.		
0000	040100	GOTO 0x100
0000	000000	NOP
Step 13: Repeat Steps 7-12 until all 23 rows of executive memory are programmed.		

12.2 Programming Verification

After the programming executive has been programmed to executive memory using ICSP, it must be verified. Verification is performed by reading out the contents of executive memory and comparing it with the image of the programming executive stored in the programmer.

Reading the contents of executive memory can be performed using the same technique described in **Section 11.10 "Reading Code Memory"**. A procedure for reading executive memory is shown in Table 12-2. Note that in Step 2, the TBLPAG register is set to 0x80 such that executive memory may be read.

TABLE 12-2: READING EXECUTIVE MEMORY

Command (Binary)	Data (Hexadecimal)	Description
Step 1: Exit the Reset vector.		

`0000`
`0000`
`0000`

TABLE 13-1: AC/DC CHARACTERISTICS (CONTINUED)

AC/DC CHARACTERISTICS			**Standard Operating Conditions** **(unless otherwise stated)** Operating Temperature: 25° C is recommended			
Param. No.	**Sym**	**Characteristic**	**Min**	**Max**	**Units**	**Conditions**
P9b	TDLY5	Delay between PGD ↓by programming executive to PGD released by programming executive	15	—	µs	—
P10	TDLY6	Delay between PGD released by programming executive to first PGC ↑ of response	5	—	µs	—
P11	TDLY7	Delay between clocking out response words	10	—	µs	—
P12a	TPROG	Row Programming cycle time	1	4	ms	ICSP mode
P12b	TPROG	Row Programming cycle time	0.8	2.6	ms	Enhanced ICSP mode
P13a	TERA	Bulk/Row Erase cycle time	1	4	ms	ICSP mode
P13b	TERA	Bulk/Row Erase cycle time	0.8	2.6	ms	Enhanced ICSP mode

APPENDIX B: HEX FILE FORMAT

Flash programmers process the standard HEX format used by the Microchip development tools. The format supported is the Intel® HEX 32 Format (INHX32). Please refer to Appendix A in the "*MPASM User's Guide"* (DS33014) for more information about hex file formats.

The basic format of the hex file is:

```
:BBAAAATTHHHH...HHHHCC
```

Each data record begins with a 9-character prefix and always ends with a 2-character checksum. All records begin with ':' regardless of the format. The individual elements are described below.

- BB - is a two-digit hexadecimal byte count representing the number of data bytes that appear on the line. Divide this number by two to get the number of words per line.
- AAAA - is a four-digit hexadecimal address representing the starting address of the data record. Format is high byte first followed by low byte. The address is doubled because this format only supports 8-bits. Divide the value by two to find the real device address.
- TT - is a two-digit record type that will be '00' for data records, '01' for end-of-file records and '04' for extended-address record.
- HHHH - is a four-digit hexadecimal data word. Format is low byte followed by high byte. There will be BB/2 data words following TT.
- CC - is a two-digit hexadecimal checksum that is the two's complement of the sum of all the preceding bytes in the line record.

Because the Intel hex file format is byte-oriented, and the 16-bit program counter is not, program memory sections require special treatment. Each 24-bit program word is extended to 32 bits by inserting a so-called "phantom byte". Each program memory address is multiplied by 2 to yield a byte address.

As an example, a section that is located at 0x100 in program memory will be represented in the hex file as 0x200.

The hex file will be produced with the following contents:

```
:020000040000fa
:040200003322110096
:00000001FF
```

Notice that the data record (line 2) has a load address of 0200, while the source code specified address 0x100. Note also that the data is represented in "little-endian" format, meaning the Least Significant Byte (LSB) appears first. The phantom byte appears last, just before the checksum.
