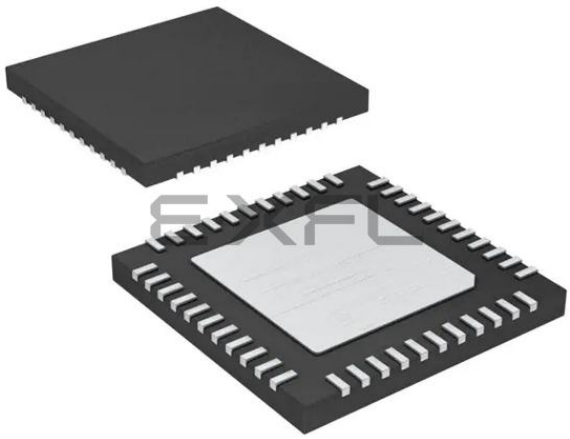
Microchip Technology - DSPIC30F4013T-20E/ML Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	dsPIC
Core Size	16-Bit
Speed	20 MIPS
Connectivity	CANbus, I²C, SPI, UART/USART
Peripherals	AC'97, Brown-out Detect/Reset, I²S, POR, PWM, WDT
Number of I/O	30
Program Memory Size	48KB (16K x 24)
Program Memory Type	FLASH
EEPROM Size	1K x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	2.5V ~ 5.5V
Data Converters	A/D 13x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	44-VQFN Exposed Pad
Supplier Device Package	44-QFN (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic30f4013t-20e-ml

2.2 Pins Used During Programming

The pins identified in Table 2-1 are used for device programming. Refer to the appropriate device data sheet for complete pin descriptions.

TABLE 2-1: dsPIC30F PIN DESCRIPTIONS DURING PROGRAMMING

Pin Name	Pin Type	Pin Description
$\overline{\text{MCLR}}$/VPP	P	Programming Enable
VDD	P	Power Supply
VSS	P	Ground
PGC	I	Serial Clock
PGD	I/O	Serial Data

Legend: I = Input, O = Output, P = Power

2.3 Program Memory Map

The program memory space extends from 0x0 to 0xFFFFFE. Code storage is located at the base of the memory map and supports up to 144 Kbytes (48K instruction words). Code is stored in three, 48 Kbyte memory panels that reside on-chip. Table 2-2 shows the location and program memory size of each device.

Locations 0x800000 through 0x8005BE are reserved for executive code memory. This region stores either the programming executive or debugging executive. The programming executive is used for device programming, while the debug executive is used for in-circuit debugging. This region of memory cannot be used to store user code.

Locations 0xF80000 through 0xF8000E are reserved for the Configuration registers. The bits in these registers may be set to select various device options, and are described in **Section 5.7 "Configuration Bits Programming"**.

Locations 0xFF0000 and 0xFF0002 are reserved for the Device ID registers. These bits can be used by the programmer to identify what device type is being programmed and are described in **Section 10.0 "Device ID"**. The device ID reads out normally, even after code protection is applied.

Figure 2-2 illustrates the memory map for the dsPIC30F devices.

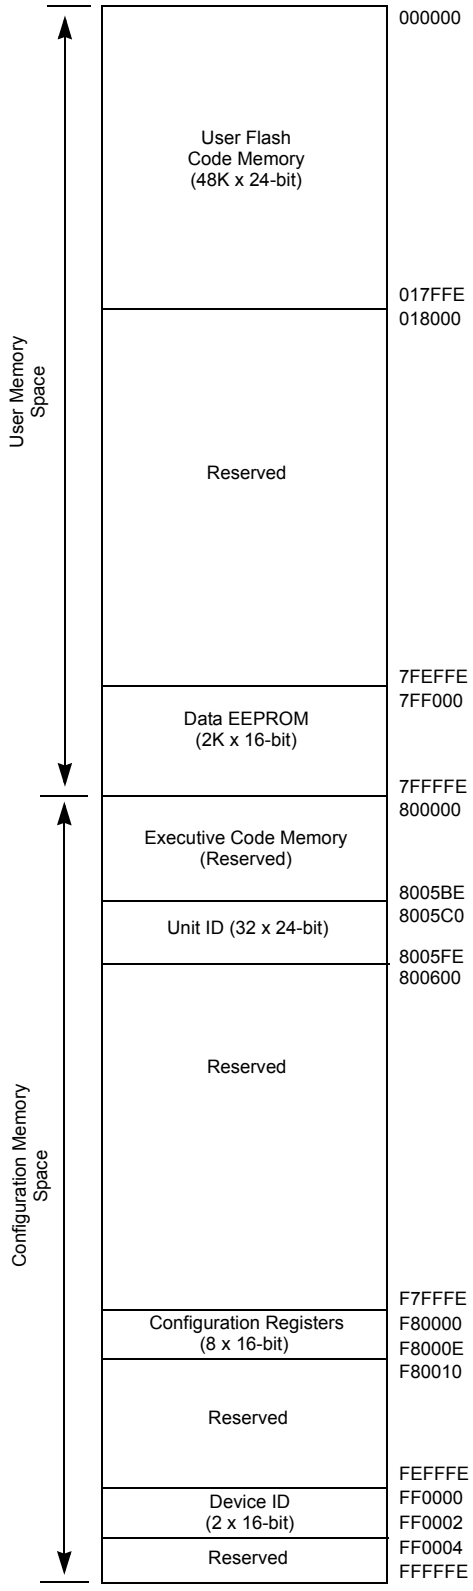
2.4 Data EEPROM Memory

The Data EEPROM array supports up to 4 Kbytes of data and is located in one memory panel. It is mapped in program memory space, residing at the end of User Memory Space (see Figure 2-2). Table 2-2 shows the location and size of data EEPROM in each device.

TABLE 2-2: CODE MEMORY AND DATA EEPROM MAP AND SIZE

Device	Code Memory map (Size in Instruction Words)	Data EEPROM Memory Map (Size in Bytes)
dsPIC30F2010	0x000000-0x001FFE (4K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F2011	0x000000-0x001FFE (4K)	None (0K)
dsPIC30F2012	0x000000-0x001FFE (4K)	None (0K)
dsPIC30F3010	0x000000-0x003FFE (8K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F3011	0x000000-0x003FFE (8K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F3012	0x000000-0x003FFE (8K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F3013	0x000000-0x003FFE (8K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F3014	0x000000-0x003FFE (8K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F4011	0x000000-0x007FFE (16K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F4012	0x000000-0x007FFE (16K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F4013	0x000000-0x007FFE (16K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F5011	0x000000-0x00AFFE (22K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F5013	0x000000-0x00AFFE (22K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F5015	0x000000-0x00AFFE (22K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F5016	0x000000-0x00AFFE (22K)	0x7FFC00-0x7FFFFE (1K)
dsPIC30F6010	0x000000-0x017FFE (48K)	0x7FF000-0x7FFFFE (4K)
dsPIC30F6010A	0x000000-0x017FFE (48K)	0x7FF000-0x7FFFFF (4K)
dsPIC30F6011	0x000000-0x015FFE (44K)	0x7FF800-0x7FFFFE (2K)
dsPIC30F6011A	0x000000-0x015FFE (44K)	0x7FF800-0x7FFFFE (2K)
dsPIC30F6012	0x000000-0x017FFE (48K)	0x7FF000-0x7FFFFE (4K)
dsPIC30F6012A	0x000000-0x017FFE (48K)	0x7FF000-0x7FFFFE (4K)
dsPIC30F6013	0x000000-0x015FFE (44K)	0x7FF800-0x7FFFFE (2K)
dsPIC30F6013A	0x000000-0x015FFE (44K)	0x7FF800-0x7FFFFE (2K)
dsPIC30F6014	0x000000-0x017FFE (48K)	0x7FF000-0x7FFFFE (4K)
dsPIC30F6014A	0x000000-0x017FFE (48K)	0x7FF000-0x7FFFFE (4K)
dsPIC30F6015	0x000000-0x017FFE (48K)	0x7FF000-0x7FFFFE (4K)

FIGURE 2-2: PROGRAM MEMORY MAP

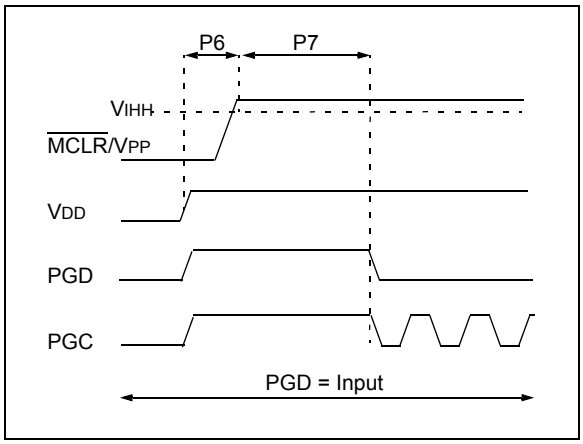


Note: The address boundaries for user Flash code memory and data EEPROM are device-dependent.

5.2 Entering Enhanced ICSP Mode

The Enhanced ICSP mode is entered by holding PGC and PGD high, and then raising MCLR/VPP to VIHH (high voltage), as illustrated in Figure 5-2. In this mode, the code memory, data EEPROM and Configuration bits can be efficiently programmed using the programming executive commands that are serially transferred using PGC and PGD.

FIGURE 5-2: ENTERING ENHANCED ICSP™ MODE



Note 1: The sequence that places the device into Enhanced ICSP mode places all unused I/Os in the high-impedance state.

2: Before entering Enhanced ICSP mode, clock switching must be disabled using ICSP, by programming the FCKSM<1:0> bits in the FOSC Configuration register to '11' or '10'.

3: When in Enhanced ICSP mode, the SPI output pin (SDO1) will toggle while the device is being programmed.

5.3 Chip Erase

Before a chip can be programmed, it must be erased. The Bulk Erase command (ERASEB) is used to perform this task. Executing this command with the MS command field set to 0x3 erases all code memory, data EEPROM and code-protect Configuration bits. The Chip Erase process sets all bits in these three memory regions to '1'.

Since non-code-protect Configuration bits cannot be erased, they must be manually set to '1' using multiple PROGC commands. One PROGC command must be sent for each Configuration register (see **Section 5.7 "Configuration Bits Programming"**).

If Advanced Security features are enabled, then individual Segment Erase operations would need to be performed, depending on which segment needs to be programmed at a given stage of system programming. The user should have the flexibility to select specific segments for programming.

Note: The Device ID registers cannot be erased. These registers remain intact after a Chip Erase is performed.

5.4 Blank Check

The term "Blank Check" means to verify that the device has been successfully erased and has no programmed memory cells. A blank or erased memory cell reads as '1'. The following memories must be blank checked:

- All implemented code memory
- All implemented data EEPROM
- All Configuration bits (for their default value)

The Device ID registers (0xFF0000:0xFF0002) can be ignored by the Blank Check since this region stores device information that cannot be erased. Additionally, all unimplemented memory space should be ignored from the Blank Check.

The QBLANK command is used for the Blank Check. It determines if the code memory and data EEPROM are erased by testing these memory regions. A 'BLANK' or 'NOT BLANK' response is returned. The READD command is used to read the Configuration registers. If it is determined that the device is not blank, it must be erased (see **Section 5.3 "Chip Erase"**) before attempting to program the chip.

TABLE 5-6: FOSC CONFIGURATION BITS DESCRIPTION FOR dsPIC30F2011/2012, dsPIC30F3010/3011/3012/3013/3014, dsPIC30F4013, dsPIC30F5015/5016, dsPIC30F6010A/6011A/6012A/6013A/6014A AND dsPIC30F6015

Bit Field	Register	Description
FCKSM<1:0>	FOSC	**Clock Switching Mode** 1x = Clock switching is disabled, Fail-Safe Clock Monitor is disabled 01 = Clock switching is enabled, Fail-Safe Clock Monitor is disabled 00 = Clock switching is enabled, Fail-Safe Clock Monitor is enabled
FOS<2:0>	FOSC	**Oscillator Source Selection on POR** 111 = Primary Oscillator 110 = Reserved 101 = Reserved 100 = Reserved 011 = Reserved 010 = Internal Low-Power RC Oscillator 001 = Internal Fast RC Oscillator (no PLL) 000 = Low-Power 32 kHz Oscillator (Timer1 Oscillator)
FPR<4:0>	FOSC	**Primary Oscillator Mode (when FOS<2:0> = 111b)** 11xxx = Reserved (do not use) 10111 = HS/3 w/PLL 16X – HS/3 crystal oscillator with 16X PLL (10 MHz-25 MHz crystal) 10110 = HS/3 w/PLL 8X – HS/3 crystal oscillator with 8X PLL (10 MHz-25 MHz crystal) 10101 = HS/3 w/PLL 4X – HS/3 crystal oscillator with 4X PLL (10 MHz-25 MHz crystal) 10100 = Reserved (do not use) 10011 = HS/2 w/PLL 16X – HS/2 crystal oscillator with 16X PLL (10 MHz-25 MHz crystal) 10010 = HS/2 w/PLL 8X – HS/2 crystal oscillator with 8X PLL (10 MHz-25 MHz crystal 10001 = HS/2 w/PLL 4X – HS/2 crystal oscillator with 4X PLL (10 MHz-25 MHz crystal) 10000 = Reserved (do not use) 01111 = ECIO w/PLL 16x – External clock with 16x PLL. OSC2 pin is I/O 01110 = ECIO w/PLL 8x – External clock with 8x PLL. OSC2 pin is I/O 01101 = ECIO w/PLL 4x – External clock with 4x PLL. OSC2 pin is I/O 01100 = Reserved (do not use) 01011 = Reserved (do not use) 01010 = FRC w/PLL 8x – Internal fast RC oscillator with 8x PLL. OSC2 pin is I/O 01001 = Reserved (do not use) 01000 = Reserved (do not use) 00111 = XT w/PLL 16X – XT crystal oscillator with 16X PLL 00110 = XT w/PLL 8X – XT crystal oscillator with 8X PLL 00101 = XT w/PLL 4X – XT crystal oscillator with 4X PLL 00100 = Reserved (do not use) 00011 = FRC w/PLL 16x – Internal fast RC oscillator with 8x PLL. OSC2 pin is I/O 00010 = Reserved (do not use) 00001 = FRC w/PLL 4x – Internal fast RC oscillator with 4x PLL. OSC2 pin is I/O 00000 = Reserved (do not use)

TABLE 5-8: dsPIC30F CONFIGURATION REGISTERS (FOR dsPIC30F2010, dsPIC30F4011/4012 AND dsPIC30F6010/ 6011/6012/6013/ 6014)

Address	Name	Bit 15	Bit 14	Bit 13	Bit 12	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

Note 1: Reserved bits read as '1' and must be programmed as '1'.

6.0 OTHER PROGRAMMING FEATURES

6.1 Erasing Memory

Memory is erased by using an ERASEB, ERASED or ERASEP command, as detailed in **Section 8.5 "Command Descriptions"**. Code memory can be erased by row using ERASEP. Data EEPROM can be erased by row using ERASED. When memory is erased, the affected memory locations are set to '1's.

ERASEB provides several Bulk Erase options. Performing a Chip Erase with the ERASEB command clears all code memory, data EEPROM and code protection registers. Alternatively, ERASEB can be used to selectively erase either all code memory or data EEPROM. Erase options are summarized in Table 6-1.

TABLE 6-1: ERASE OPTIONS

Command	Affected Region
ERASEB	Entire chip(1) or all code memory or all data EEPROM, or erase by segment
ERASED	Specified rows of data EEPROM
ERASEP(2)	Specified rows of code memory

Note 1: The system operation Configuration registers and device ID registers are not erasable.

2: ERASEP cannot be used to erase code-protect Configuration bits. These bits must be erased using ERASEB.

6.2 Modifying Memory

Instead of bulk-erasing the device before programming, it is possible that you may want to modify only a section of an already programmed device. In this situation, Chip Erase is not a realistic option.

Instead, you can erase selective rows of code memory and data EEPROM using ERASEP and ERASED, respectively. You can then reprogram the modified rows with the PROGP and PROGD command pairs. In these cases, when code memory is programmed, single-panel programming must be specified in the PROGP command.

For modification of Advanced Code Protection bits for a particular segment, the entire chip must first be erased with the ERASEB command. Alternatively, on devices that support Advanced Security, individual segments (code and/or data EEPROM) may be erased, by suitably changing the MS (Memory Select) field in the ERASEB command. The code-protect Configuration bits can then be reprogrammed using the PROGC command.

Note: If read or write code protection is enabled for a segment, no modifications can be made to that segment until code protection is disabled. Code protection can only be disabled by performing a Chip Erase or by performing a Segment Erase operation for the required segment.

6.3 Reading Memory

The READD command reads the data EEPROM, Configuration bits and device ID of the device. This command only returns 16-bit data and operates on 16-bit registers. READD can be used to return the entire contents of data EEPROM.

The READP command reads the code memory of the device. This command only returns 24-bit data packed as described in **Section 8.3 "Packed Data Format"**. READP can be used to read up to 32K instruction words of code memory.

Note: Reading an unimplemented memory location causes the programming executive to reset. All READD and READP commands **must** specify only valid memory locations.

6.4 Programming Executive Software Version

At times, it may be necessary to determine the version of programming executive stored in executive memory. The QVER command performs this function. See **Section 8.5.11 "QVER Command"** for more details about this command.

6.5 Data EEPROM Information in the Hexadecimal File

To allow portability of code, the programmer must read the data EEPROM information from the hexadecimal file. If data EEPROM information is not present, a simple warning message should be issued by the programmer. Similarly, when saving a hexadecimal file, all data EEPROM information must be included. An option to not include the data EEPROM information can be provided.

Microchip Technology Inc. believes that this feature is important for the benefit of the end customer.

8.0 PROGRAMMING EXECUTIVE COMMANDS

8.1 Command Set

The programming executive command set is shown in Table 8-1. This table contains the opcode, mnemonic, length, time out and description for each command. Functional details on each command are provided in the command descriptions (see **Section 8.5 "Command Descriptions"**).

8.2 Command Format

All programming executive commands have a general format consisting of a 16-bit header and any required data for the command (see Figure 8-1). The 16-bit header consists of a 4-bit opcode field, which is used to identify the command, followed by a 12-bit command length field.

FIGURE 8-1: COMMAND FORMAT

15 12	11 0
Opcode	Length
Command Data First Word (if required)	
•	
•	
Command Data Last Word (if required)	

The command opcode must match one of those in the command set. Any command that is received which does not match the list in Table 8-1 will return a "NACK" response (see **Section 9.2.1 "Opcode Field"**).

The command length is represented in 16-bit words since the SPI operates in 16-bit mode. The programming executive uses the Command Length field to determine the number of words to read from the SPI port. If the value of this field is incorrect, the command will not be properly received by the programming executive.

8.3 Packed Data Format

When 24-bit instruction words are transferred across the 16-bit SPI interface, they are packed to conserve space using the format shown in Figure 8-2. This format minimizes traffic over the SPI and provides the programming executive with data that is properly aligned for performing table write operations.

FIGURE 8-2: PACKED INSTRUCTION WORD FORMAT

15 8	7 0
lsw1	
MSB2	MSB1
lsw2	

lswx: Least significant 16 bits of instruction word
MSBx: Most Significant Byte of instruction word

Note:	When the number of instruction words transferred is odd, MSB2 is zero and lsw2 cannot be transmitted.

8.4 Programming Executive Error Handling

The programming executive will "NACK" all unsupported commands. Additionally, due to the memory constraints of the programming executive, no checking is performed on the data contained in the Programmer command. It is the responsibility of the programmer to command the programming executive with valid command arguments, or the programming operation may fail. Additional information on error handling is provided in **Section 9.2.3 "QE_Code Field"**.

TABLE 8-1: PROGRAMMING EXECUTIVE COMMAND SET

Opcode	Mnemonic	Length (16-bit words)	Time Out	Description
0x0	SCHECK	1	1 ms	Sanity check.
0x1	READD	4	1 ms/row	Read N 16-bit words of data EEPROM, Configuration registers or device ID starting from specified address.
0x2	READP	4	1 ms/row	Read N 24-bit instruction words of code memory starting from specified address.
0x3	Reserved	N/A	N/A	This command is reserved. It will return a NACK.
0x4	PROGD(2)	19	5 ms	Program one row of data EEPROM at the specified address, then verify.
0x5	PROGP(1)	51	5 ms	Program one row of code memory at the specified address, then verify.
0x6	PROGC	4	5 ms	Write byte or 16-bit word to specified Configuration register.
0x7	ERASEB	2	5 ms	Bulk Erase (entire code memory or data EEPROM), or erase by segment.
0x8	ERASED(2)	3	5 ms/row	Erase rows of data EEPROM from specified address.
0x9	ERASEP(1)	3	5 ms/row	Erase rows of code memory from specified address.
0xA	QBLANK	3	300 ms	Query if the code memory and data EEPROM are blank.
0xB	QVER	1	1 ms	Query the programming executive software version.

Note 1: One row of code memory consists of (32) 24-bit words. Refer to Table 5-2 for device-specific information.
2: One row of data EEPROM consists of (16) 16-bit words. Refer to Table 5-3 for device-specific information.

8.5 Command Descriptions

All commands that are supported by the programming executive are described in **Section 8.5.1 "SCHECK Command"** through **Section 8.5.11 "QVER Command"**.

8.5.1 SCHECK COMMAND

15 12	11 0
Opcode	Length

Field	Description
Opcode	0x0
Length	0x1

The SCHECK command instructs the programming executive to do nothing, but generate a response. This command is used as a "sanity check" to verify that the programming executive is operational.

Expected Response (2 words):
0x1000
0x0002

Note:	This instruction is not required for programming, but is provided for development purposes only.

8.5.2 READD COMMAND

15 12	11 8	7 0
Opcode	Length	
Reserved0	N	
Reserved1		Addr_MSB
Addr_LS		

Field	Description
Opcode	0x1
Length	0x4
Reserved0	0x0
N	Number of 16-bit words to read (max of 2048)
Reserved1	0x0
Addr_MSB	MSB of 24-bit source address
Addr_LS	LS 16 bits of 24-bit source address

The READD command instructs the programming executive to read N 16-bit words of memory starting from the 24-bit address specified by Addr_MSB and Addr_LS. This command can only be used to read 16-bit data. It can be used to read data EEPROM, Configuration registers and the device ID.

Expected Response (2+N words):
0x1100
N + 2
Data word 1
...
Data word N

Note:	Reading unimplemented memory will cause the programming executive to reset.

8.5.3 READP COMMAND

15 12	11 8	7 0
Opcode	Length	
N		
Reserved	Addr_MSB	
Addr_LS		

Field	Description
Opcode	0x2
Length	0x4
N	Number of 24-bit instructions to read (max of 32768)
Reserved	0x0
Addr_MSB	MSB of 24-bit source address
Addr_LS	LS 16 bits of 24-bit source address

The READP command instructs the programming executive to read N 24-bit words of code memory starting from the 24-bit address specified by Addr_MSB and Addr_LS. This command can only be used to read 24-bit data. All data returned in response to this command uses the packed data format described in **Section 8.3 "Packed Data Format"**.

Expected Response (2 + 3 * N/2 words for N even):
0x1200
2 + 3 * N/2
Least significant program memory word 1
...
Least significant data word N

Expected Response (4 + 3 * (N – 1)/2 words for N odd):
0x1200
4 + 3 * (N – 1)/2
Least significant program memory word 1
...
MSB of program memory word N (zero padded)

Note:	Reading unimplemented memory will cause the programming executive to reset.

8.5.4 PROGD COMMAND

15 12	11 8	7 0
Opcode	Length	
Reserved	Addr_MSB	
Addr_LS		
D_1		
D_2		
...		
D_16		

Field	Description
Opcode	0x4
Length	0x13
Reserved	0x0
Addr_MSB	MSB of 24-bit destination address
Addr_LS	LS 16 bits of 24-bit destination address
D_1	16-bit data word 1
D_2	16-bit data word 2
...	16-bit data words 3 through 15
D_16	16-bit data word 16

The PROGD command instructs the programming executive to program one row of data EEPROM. The data to be programmed is specified by the 16 data words (D_1, D_2,..., D_16) and is programmed to the destination address specified by Addr_MSB and Addr_LSB. The destination address should be a multiple of 0x20.

Once the row of data EEPROM has been programmed, the programming executive verifies the programmed data against the data in the command.

Expected Response (2 words):
0x1400
0x0002

Note:	Refer to Table 5-3 for data EEPROM size information.

8.5.7 ERASEB COMMAND

15 12	11 2	0
Opcode	Length	
Reserved		MS

Field	Description
Opcode	0x7
Length	0x2
Reserved	0x0
MS	Select memory to erase: 0x0 = All Code in General Segment 0x1 = All Data EEPROM in General Segment 0x2 = All Code and Data EEPROM in General Segment, interrupt vectors and FGS Configuration register 0x3 = Full Chip Erase 0x4 = All Code and Data EEPROM in Boot, Secure and General Segments, and FBS, FSS and FGS Configuration registers 0x5 = All Code and Data EEPROM in Secure and General Segments, and FSS and FGS Configuration registers 0x6 = All Data EEPROM in Boot Segment 0x7 = All Data EEPROM in Secure Segment

The ERASEB command performs a Bulk Erase. The MS field selects the memory to be bulk erased, with options for erasing Code and/or Data EEPROM in individual memory segments.

When Full Chip Erase is selected, the following memory regions are erased:

- All code memory (even if code-protected)
- All data EEPROM
- All code-protect Configuration registers

Only the executive code memory, Unit ID, device ID and Configuration registers that are not code-protected remain intact after a Chip Erase.

Expected Response (2 words):
0x1700
0x0002

Note:	A Full Chip Erase cannot be performed in low-voltage programming systems (V_{DD} less than 4.5 volts). ERASED and ERASEP must be used to erase code memory, executive memory and data memory. Alternatively, individual Segment Erase operations may be performed.

8.5.8 ERASED COMMAND

15 12	11 8	7 0
Opcode	Length	
Num_Rows		Addr_MSB
Addr_LS		

Field	Description
Opcode	0x8
Length	0x3
Num_Rows	Number of rows to erase (max of 128)
Addr_MSB	MSB of 24-bit base address
Addr_LS	LS 16 bits of 24-bit base address

The ERASED command erases the specified number of rows of data EEPROM from the specified base address. The specified base address must be a multiple of 0x20. Since the data EEPROM is mapped to program space, a 24-bit base address must be specified.

After the erase is performed, all targeted bytes of data EEPROM will contain 0xFF.

Expected Response (2 words):
0x1800
0x0002

Note:	The ERASED command cannot be used to erase the Configuration registers or device ID. Code-protect Configuration registers can only be erased with the ERASEB command, while the device ID is read-only.

11.0 ICSP™ MODE

11.1 ICSP Mode

ICSP mode is a special programming protocol that allows you to read and write to the dsPIC30F programming executive. The ICSP mode is the second (and slower) method used to program the device. This mode also has the ability to read the contents of executive memory to determine whether the programming executive is present. This capability is accomplished by applying control codes and instructions serially to the device using pins PGC and PGD.

In ICSP mode, the system clock is taken from the PGC pin, regardless of the device's oscillator Configuration bits. All instructions are first shifted serially into an internal buffer, then loaded into the Instruction register and executed. No program fetching occurs from internal memory. Instructions are fed in 24 bits at a time. PGD is used to shift data in and PGC is used as both the serial shift clock and the CPU execution clock.

Data is transmitted on the rising edge and latched on the falling edge of PGC. For all data transmissions, the Least Significant bit (LSb) is transmitted first.

Note 1: During ICSP operation, the operating frequency of PGC must not exceed 5 MHz.

2: Because ICSP is slower, it is recommended that only Enhanced ICSP (E-ICSP) mode be used for device programming, as described in **Section 5.1 "Overview of the Programming Process"**.

11.2 ICSP Operation

Upon entry into ICSP mode, the CPU is idle. Execution of the CPU is governed by an internal state machine. A 4-bit control code is clocked in using PGC and PGD, and this control code is used to command the CPU (see Table 11-1).

The SIX control code is used to send instructions to the CPU for execution, while the REGOUT control code is used to read data out of the device via the VISI register. The operation details of ICSP mode are provided in **Section 11.2.1 "SIX Serial Instruction Execution"** and **Section 11.2.2 "REGOUT Serial Instruction Execution"**.

TABLE 11-1: CPU CONTROL CODES IN ICSP™ MODE

4-bit Control Code	Mnemonic	Description
0000b	SIX	Shift in 24-bit instruction and execute.
0001b	REGOUT	Shift out the VISI register.
0010b-1111b	N/A	Reserved.

11.2.1 SIX SERIAL INSTRUCTION EXECUTION

The SIX control code allows execution of dsPIC30F assembly instructions. When the SIX code is received, the CPU is suspended for 24 clock cycles as the instruction is then clocked into the internal buffer. Once the instruction is shifted in, the state machine allows it to be executed over the next four clock cycles. While the received instruction is executed, the state machine simultaneously shifts in the next 4-bit command (see Figure 11-2).

Note 1: Coming out of the ICSP entry sequence, the first 4-bit control code is always forced to SIX and a forced NOP instruction is executed by the CPU. Five additional PGC clocks are needed on start-up, thereby resulting in a 9-bit SIX command instead of the normal 4-bit SIX command. After the forced SIX is clocked in, ICSP operation resumes as normal (the next 24 clock cycles load the first instruction word to the CPU). See Figure 11-1 for details.

2: TBLRDH, TBLRDL, TBLWTH and TBLWTL instructions must be followed by a NOP instruction.

11.4 Flash Memory Programming in ICSP Mode

Programming in ICSP mode is described in **Section 11.4.1 "Programming Operations"** through **Section 11.4.3 "Starting and Stopping a Programming Cycle"**. Step-by-step procedures are described in **Section 11.5 "Erasing Program Memory in Normal-Voltage Systems"** through **Section 11.13 "Reading the Application ID Word"**. All programming operations must use serial execution, as described in **Section 11.2 "ICSP Operation"**.

11.4.1 PROGRAMMING OPERATIONS

Flash memory write and erase operations are controlled by the NVMCON register. Programming is performed by setting NVMCON to select the type of erase operation (Table 11-2) or write operation (Table 11-3), writing a key sequence to enable the programming and initiating the programming by setting the WR control bit, NVMCON<15>.

In ICSP mode, all programming operations are externally timed. An external 2 ms delay must be used between setting the WR control bit and clearing the WR control bit to complete the programming operation.

TABLE 11-2: NVMCON ERASE OPERATIONS

NVMCON Value	Erase Operation
0x407F	Erase all code memory, data memory (does not erase UNIT ID).
0x4075	Erase 1 row (16 words) of data EEPROM.
0x4074	Erase 1 word of data EEPROM.
0x4072	Erase all executive memory.
0x4071	Erase 1 row (32 instruction words) from 1 panel of code memory.
0x406E	Erase Boot Secure and General Segments, then erase FBS, FSS and FGS configuration registers.
0x4066	Erase all Data EEPROM allocated to Boot Segment.
0x405E	Erase Secure and General Segments, then erase FSS and FGS configuration registers.
0x4056	Erase all Data EEPROM allocated to Secure Segment.
0x404E	Erase General Segment, then erase FGS configuration register.
0x4046	Erase all Data EEPROM allocated to General Segment.

TABLE 11-3: NVMCON WRITE OPERATIONS

NVMCON Value	Write Operation
0x4008	Write 1 word to configuration memory.
0x4005	Write 1 row (16 words) to data memory.
0x4004	Write 1 word to data memory.
0x4001	Write 1 row (32 instruction words) into 1 panel of program memory.

11.4.2 UNLOCKING NVMCON FOR PROGRAMMING

Writes to the WR bit (NVMCON<15>) are locked to prevent accidental programming from taking place. Writing a key sequence to the NVMKEY register unlocks the WR bit and allows it to be written to. The unlock sequence is performed as follows:

```
MOV     #0x55, W8
MOV     W8, NVMKEY
MOV     #0xAA, W9
MOV     W9, NVMKEY
```

Note: Any working register, or working register pair, can be used to write the unlock sequence.

11.4.3 STARTING AND STOPPING A PROGRAMMING CYCLE

Once the unlock key sequence has been written to the NVMKEY register, the WR bit (NVMCON<15>) is used to start and stop an erase or write cycle. Setting the WR bit initiates the programming cycle. Clearing the WR bit terminates the programming cycle.

All erase and write cycles must be externally timed. An external delay must be used between setting and clearing the WR bit. Starting and stopping a programming cycle is performed as follows:

```
BSET    NVMCON, #WR
<Wait 2 ms>
BCLR    NVMCON, #WR
```

11.5 Erasing Program Memory in Normal-Voltage Systems

The procedure for erasing program memory (all code memory, data memory, executive memory and code-protect bits) consists of setting NVMCON to 0x407F, unlocking NVMCON for erasing and then executing the programming cycle. This method of bulk erasing program memory only works for systems where VDD is between 4.5 volts and 5.5 volts. The method for erasing program memory for systems with a lower VDD (3.0 volts-4.5 volts) is described in **Section 6.1 "Erasing Memory"**.

Table 11-4 shows the ICSP programming process for bulk-erasing program memory. This process includes the ICSP command code, which must be transmitted (for each instruction) to the Least Significant bit first using the PGC and PGD pins (see Figure 11-2).

If an individual Segment Erase operation is required, the NVMCON value must be replaced by the value for the corresponding Segment Erase operation.

Note:	Program memory must be erased before writing any data to program memory.

TABLE 11-4: SERIAL INSTRUCTION EXECUTION FOR BULK ERASING PROGRAM MEMORY (ONLY IN NORMAL-VOLTAGE SYSTEMS)

Command (Binary)	Data (Hexadecimal)	Description
Step 1: Exit the Reset vector.		
0000 0000 0000	040100 040100 000000	GOTO 0x100 GOTO 0x100 NOP
Step 2: Set NVMCON to program the FBS Configuration register.(1)		
0000 0000	24008A 883B0A	MOV #0x4008, W10 MOV W10, NVMCON
Step 3: Initialize the TBLPAG and write pointer (W7) for TBLWT instruction for Configuration register.(1)		

0000
0000
0000
	200F80
	880190
	200067
		MOV #0xF8, W0
		MOV W0, TBLPAG
		MOV #0x6, W7

Step 4: Load the Configuration Register data to W6.(1)		
0000 0000	EB0300 000000	CLR W6 NOP
Step 5: Load the Configuration Register write latch. Advance W7 to point to next Configuration register.(1)		
0000	BB1B86	TBLWTL W6, [W7++]
Step 6: Unlock the NVMCON for programming the Configuration register.(1)		

0000
0000
0000
0000
	200558
	200AA9
	883B38
	883B39
		MOV #0x55, W8
		MOV #0xAA, W9
		MOV W8, NVMKEY
		MOV W9, NVMKEY

Step 7: Initiate the programming cycle.(1)		
0000 0000 0000 – 0000 0000 0000 0000 0000	A8E761 000000 000000 – 000000 000000 A9E761 000000 000000	BSET NVMCON, #WR NOP NOP Externally time 2 ms NOP NOP BCLR NVMCON, #WR NOP NOP
Step 8: Repeat steps 5-7 one time to program 0x0000 to RESERVED2 Configuration register.(1)		
Step 9: Set the NVMCON to erase all Program Memory.		
00000 0000	2407FA 883B0A	MOV #0x407F, W10 MOV W10, NVMCON
Step 10: Unlock the NVMCON for programming.		

Note 1: Steps 2-8 are only required for the dsPIC30F5011/5013 devices. These steps may be skipped for all other devices in the dsPIC30F family.

TABLE 11-7: SERIAL INSTRUCTION EXECUTION FOR WRITING CONFIGURATION REGISTERS (CONTINUED)

Command (Binary)	Data (Hexadecimal)	Description
Step 6: Write the Configuration register data to the write latch and increment the write pointer.		
0000	BB1B96	TBLWTL W6, [W7++]
0000	000000	NOP
0000	000000	NOP
Step 7: Unlock the NVMCON for programming.		
0000	200558	MOV #0x55, W8
0000	883B38	MOV W8, NVMKEY
0000	200AA9	MOV #0xAA, W9
0000	883B39	MOV W9, NVMKEY
Step 8: Initiate the write cycle.		
0000	A8E761	BSET NVMCON, #WR
0000	000000	NOP
0000	000000	NOP
—	—	Externally time 'P12a' ms (see **Section 13.0 "AC/DC Characteristics and Timing Requirements"**)
0000	000000	NOP
0000	000000	NOP
0000	A9E761	BCLR NVMCON, #WR
0000	000000	NOP
0000	000000	NOP
Step 9: Reset device internal PC.		
0000	040100	GOTO 0x100
0000	000000	NOP
Step 10: Repeat steps 3-9 until all 7 Configuration registers are cleared.		

TABLE 11-10: SERIAL INSTRUCTION EXECUTION FOR READING CODE MEMORY (CONTINUED)

Command (Binary)	Data (Hexadecimal)	Description
Step 4: Output W0:W5 using the VISI register and REGOUT command.		
0000	883C20	MOV W0, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C21	MOV W1, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C22	MOV W2, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C23	MOV W3, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C24	MOV W4, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C25	MOV W5, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
Step 5: Reset the device internal PC.		
0000	040100	GOTO 0x100
0000	000000	NOP
Step 6: Repeat steps 3-5 until all desired code memory is read.		

12.2 Programming Verification

After the programming executive has been programmed to executive memory using ICSP, it must be verified. Verification is performed by reading out the contents of executive memory and comparing it with the image of the programming executive stored in the programmer.

Reading the contents of executive memory can be performed using the same technique described in **Section 11.10 "Reading Code Memory"**. A procedure for reading executive memory is shown in Table 12-2. Note that in Step 2, the TBLPAG register is set to 0x80 such that executive memory may be read.

TABLE 12-2: READING EXECUTIVE MEMORY

Command (Binary)	Data (Hexadecimal)	Description
Step 1: Exit the Reset vector.		
0000	040100	GOTO 0x100
0000	040100	GOTO 0x100
0000	000000	NOP
Step 2: Initialize TBLPAG and the read pointer (W6) for TBLRD instruction.		
0000	200800	MOV #0x80, W0
0000	880190	MOV W0, TBLPAG
0000	EB0300	CLR W6
Step 3: Initialize the write pointer (W7), and store the next four locations of executive memory to W0:W5.		
0000	EB0380	CLR W7
0000	000000	NOP
0000	BA1B96	TBLRDL [W6], [W7++]
0000	000000	NOP
