Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	dsPIC
Core Size	16-Bit
Speed	20 MIPS
Connectivity	CANbus, I²C, SPI, UART/USART
Peripherals	AC'97, Brown-out Detect/Reset, I²S, LVD, POR, PWM, WDT
Number of I/O	68
Program Memory Size	144KB (48K x 24)
Program Memory Type	FLASH
EEPROM Size	4K x 8
RAM Size	8K x 8
Voltage - Supply (Vcc/Vdd)	2.5V ~ 5.5V
Data Converters	A/D 16x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	80-TQFP
Supplier Device Package	80-TQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/dspic30f6014at-20e-pf

5.5.3 PROGRAMMING VERIFICATION

Once code memory is programmed, the contents of memory can be verified to ensure that programming was successful. Verification requires code memory to be read back and compared against the copy held in the programmer's buffer.

The `READP` command can be used to read back all the programmed code memory.

Alternatively, you can have the programmer perform the verification once the entire device is programmed using a checksum computation, as described in **Section 6.8 "Checksum Computation"**.

5.6 Data EEPROM Programming

5.6.1 OVERVIEW

The panel architecture for the data EEPROM memory array consists of 128 rows of sixteen 16-bit data words. Each panel stores 2K words. All devices have either one or no memory panels. Devices with data EEPROM provide either 512 words, 1024 words or 2048 words of memory on the one panel (see Table 5-3).

TABLE 5-3: DATA EEPROM SIZE

Device	Data EEPROM Size (Words)	Number of Rows
dsPIC30F2010	512	32
dsPIC30F2011	0	0
dsPIC30F2012	0	0
dsPIC30F3010	512	32
dsPIC30F3011	512	32
dsPIC30F3012	512	32
dsPIC30F3013	512	32
dsPIC30F3014	512	32
dsPIC30F4011	512	32
dsPIC30F4012	512	32
dsPIC30F4013	512	32
dsPIC30F5011	512	32
dsPIC30F5013	512	32
dsPIC30F5015	512	32
dsPIC30F5016	512	32
dsPIC30F6010	2048	128
dsPIC30F6010A	2048	128
dsPIC30F6011	1024	64
dsPIC30F6011A	1024	64
dsPIC30F6012	2048	128
dsPIC30F6012A	2048	128
dsPIC30F6013	1024	64
dsPIC30F6013A	1024	64
dsPIC30F6014	2048	128
dsPIC30F6014A	2048	128
dsPIC30F6015	2048	128

5.6.2 PROGRAMMING METHODOLOGY

The programming executive uses the `PROGD` command to program the data EEPROM. Figure 5-4 illustrates the flowchart of the process. Firstly, the number of rows to program (RemainingRows) is based on the device size, and the destination address (DestAddress) is set to '0'. In this example, 128 rows (2048 words) of data EEPROM will be programmed.

The first `PROGD` command programs the first row of data EEPROM. Once the command completes successfully, 'RemainingRows' is decremented by 1 and compared with 0. Since there are 127 more rows to program, 'BaseAddress' is incremented by 0x20 to point to the next row of data EEPROM. This process is then repeated until all 128 rows of data EEPROM are programmed.

FIGURE 5-4: FLOWCHART FOR PROGRAMMING dsPIC30F6014A DATA EEPROM

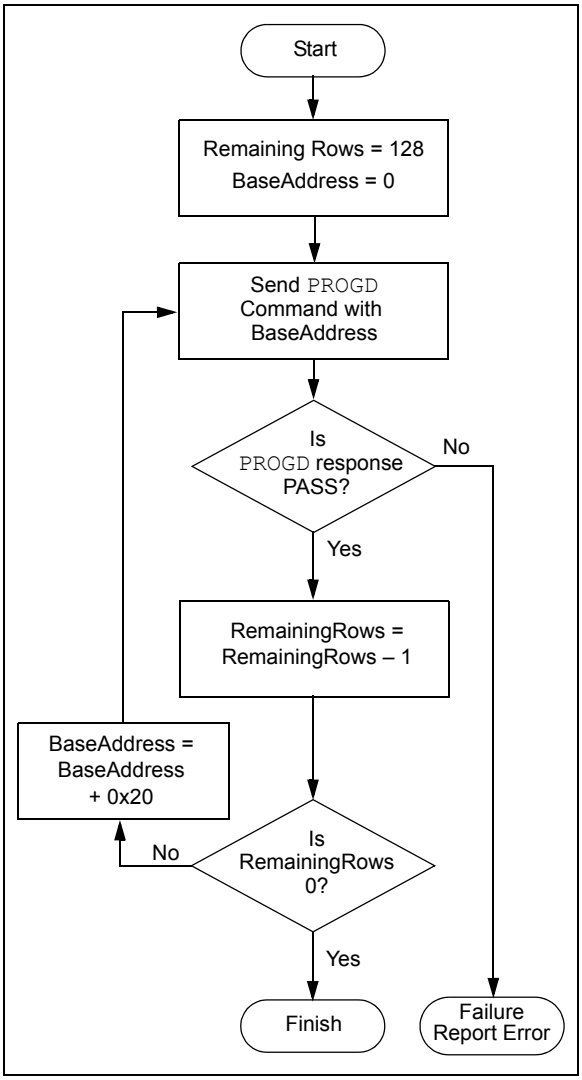

TABLE 5-7: CONFIGURATION BITS DESCRIPTION (CONTINUED)

Bit Field	Register	Description
EBS	FBS	**Boot Segment Data EEPROM Code Protection (only present in dsPIC30F5011/5013/6010A/6011A/6012A/6013A/6014A/6015)** 1 = No Data EEPROM is reserved for Boot Segment 0 = 128 bytes of Data EEPROM are reserved for Boot Segment in dsPIC30F5011/5013, and 256 bytes in dsPIC30F6010A/6011A/6012A/6013A/6014A/6015

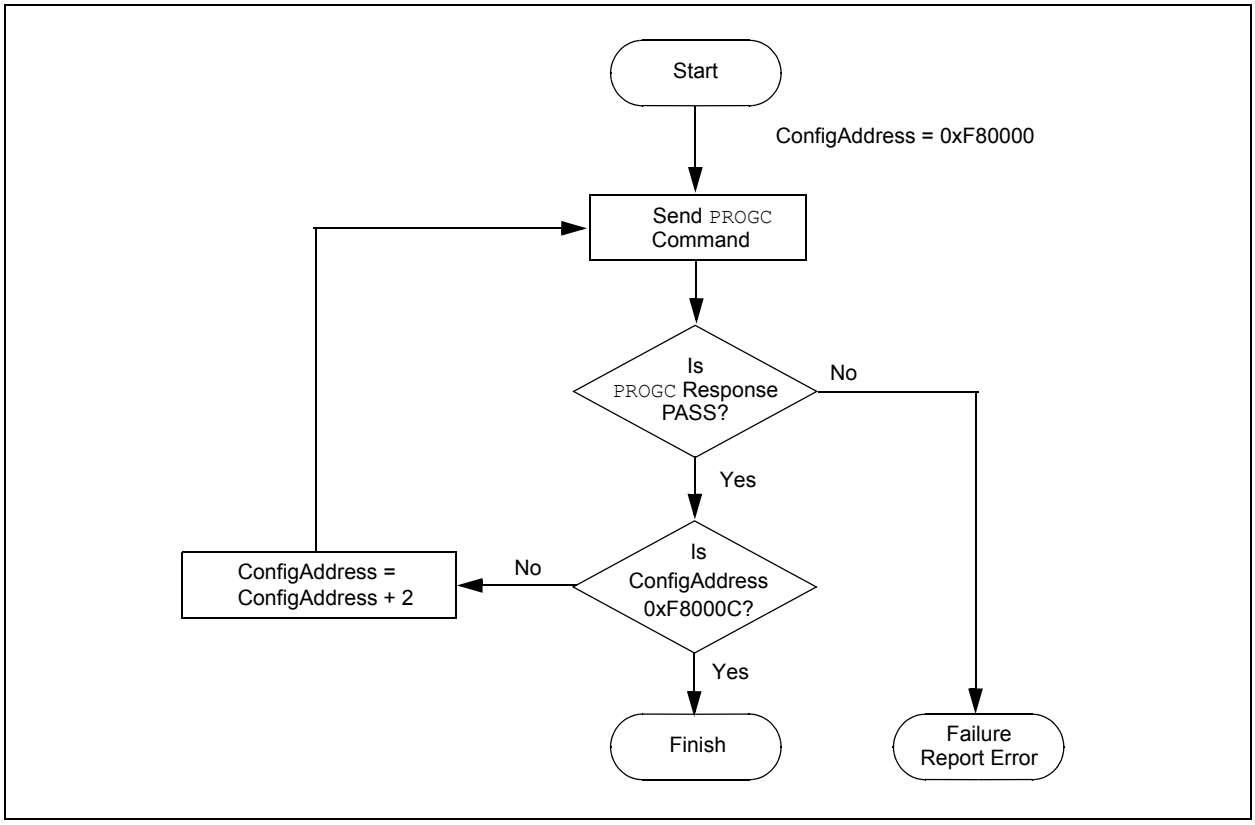
ESS<1:0>	FSS	**Secure Segment Data EEPROM Code Protection (only present in dsPIC30F5011/5013/6010A/6011A/6012A/6013A/6014A/6015)** 11 = No Data EEPROM is reserved for Secure Segment 10 = Small-sized Secure Data EEPROM [(128 – N) bytes of Data EEPROM are reserved for Secure Segment in dsPIC30F5011/5013, and (256 – N) bytes in dsPIC30F6010A/6011A/6012A/6013A/6014A/6015] 01 = Medium-sized Secure Data EEPROM [(256 – N) bytes of Data EEPROM are reserved for Secure Segment in dsPIC30F5011/5013, and (512 – N) bytes in dsPIC30F6010A/6011A/6012A/6013A/6014A/6015] 00 = Large-sized Secure Data EEPROM [(512 – N) bytes of Data EEPROM are reserved for Secure Segment in dsPIC30F5011/5013, (1024 – N) bytes in dsPIC30F6011A/6013A, and (2048 – N) bytes in dsPIC30F6010A/6012A/6014A/6015] where N = Number of bytes of Data EEPROM reserved for Boot Sector.

5.8 Exiting Enhanced ICSP Mode

The Enhanced ICSP mode is exited by removing power from the device or bringing MCLR to VIL. When normal user mode is next entered, the program that was stored using Enhanced ICSP will execute.

FIGURE 5-5: CONFIGURATION BIT PROGRAMMING FLOW



6.0 OTHER PROGRAMMING FEATURES

6.1 Erasing Memory

Memory is erased by using an ERASEB, ERASED or ERASEP command, as detailed in **Section 8.5 "Command Descriptions"**. Code memory can be erased by row using ERASEP. Data EEPROM can be erased by row using ERASED. When memory is erased, the affected memory locations are set to '1's.

ERASEB provides several Bulk Erase options. Performing a Chip Erase with the ERASEB command clears all code memory, data EEPROM and code protection registers. Alternatively, ERASEB can be used to selectively erase either all code memory or data EEPROM. Erase options are summarized in Table 6-1.

TABLE 6-1: ERASE OPTIONS

Command	Affected Region
ERASEB	Entire chip(1) or all code memory or all data EEPROM, or erase by segment
ERASED	Specified rows of data EEPROM
ERASEP(2)	Specified rows of code memory

Note 1: The system operation Configuration registers and device ID registers are not erasable.

2: ERASEP cannot be used to erase code-protect Configuration bits. These bits must be erased using ERASEB.

6.2 Modifying Memory

Instead of bulk-erasing the device before programming, it is possible that you may want to modify only a section of an already programmed device. In this situation, Chip Erase is not a realistic option.

Instead, you can erase selective rows of code memory and data EEPROM using ERASEP and ERASED, respectively. You can then reprogram the modified rows with the PROGP and PROGD command pairs. In these cases, when code memory is programmed, single-panel programming must be specified in the PROGP command.

For modification of Advanced Code Protection bits for a particular segment, the entire chip must first be erased with the ERASEB command. Alternatively, on devices that support Advanced Security, individual segments (code and/or data EEPROM) may be erased, by suitably changing the MS (Memory Select) field in the ERASEB command. The code-protect Configuration bits can then be reprogrammed using the PROGC command.

Note: If read or write code protection is enabled for a segment, no modifications can be made to that segment until code protection is disabled. Code protection can only be disabled by performing a Chip Erase or by performing a Segment Erase operation for the required segment.

6.3 Reading Memory

The READD command reads the data EEPROM, Configuration bits and device ID of the device. This command only returns 16-bit data and operates on 16-bit registers. READD can be used to return the entire contents of data EEPROM.

The READP command reads the code memory of the device. This command only returns 24-bit data packed as described in **Section 8.3 "Packed Data Format"**. READP can be used to read up to 32K instruction words of code memory.

Note: Reading an unimplemented memory location causes the programming executive to reset. All READD and READP commands **must** specify only valid memory locations.

6.4 Programming Executive Software Version

At times, it may be necessary to determine the version of programming executive stored in executive memory. The QVER command performs this function. See **Section 8.5.11 "QVER Command"** for more details about this command.

6.5 Data EEPROM Information in the Hexadecimal File

To allow portability of code, the programmer must read the data EEPROM information from the hexadecimal file. If data EEPROM information is not present, a simple warning message should be issued by the programmer. Similarly, when saving a hexadecimal file, all data EEPROM information must be included. An option to not include the data EEPROM information can be provided.

Microchip Technology Inc. believes that this feature is important for the benefit of the end customer.

clocked out. The programmer can begin to clock out the response 20 µsec after PGD is brought low, and it must provide the necessary amount of clock pulses to receive the entire response from the programming executive.

Once the entire response is clocked out, the programmer should terminate the clock on PGC until it is time to send another command to the programming executive. This protocol is illustrated in Figure 7-2.

7.3 SPI Rate

In Enhanced ICSP mode, the dsPIC30F operates from the fast internal RC oscillator, which has a nominal frequency of 7.37 MHz. This oscillator frequency yields an effective system clock frequency of 1.84 MHz. Since the SPI module operates in Slave mode, the programmer must limit the SPI clock rate to a frequency no greater than 1 MHz.

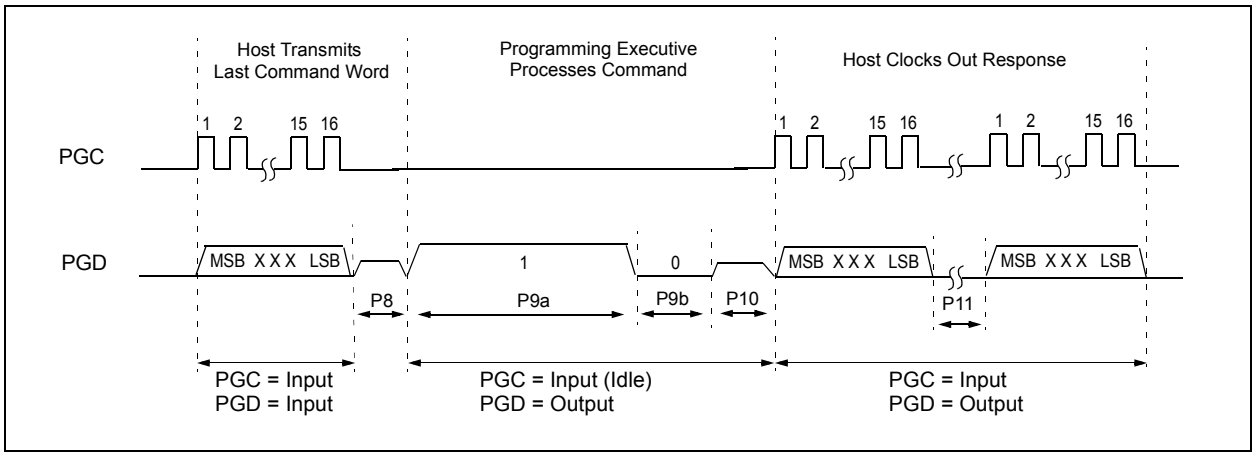
Note:	If the programmer provides the SPI with a clock faster than 1 MHz, the behavior of the programming executive will be unpredictable.

7.4 Time Outs

The programming executive uses no Watchdog Timer or time out for transmitting responses to the programmer. If the programmer does not follow the flow control mechanism using PGC, as described in **Section 7.2 "Communication Interface and Protocol"**, it is possible that the programming executive will behave unexpectedly while trying to send a response to the programmer. Since the programming executive has no time out, it is imperative that the programmer correctly follow the described communication protocol.

As a safety measure, the programmer should use the command time outs identified in Table 8-1. If the command time out expires, the programmer should reset the programming executive and start programming the device again.

FIGURE 7-2: PROGRAMMING EXECUTIVE – PROGRAMMER COMMUNICATION PROTOCOL



8.0 PROGRAMMING EXECUTIVE COMMANDS

8.1 Command Set

The programming executive command set is shown in Table 8-1. This table contains the opcode, mnemonic, length, time out and description for each command. Functional details on each command are provided in the command descriptions (see **Section 8.5 "Command Descriptions"**).

8.2 Command Format

All programming executive commands have a general format consisting of a 16-bit header and any required data for the command (see Figure 8-1). The 16-bit header consists of a 4-bit opcode field, which is used to identify the command, followed by a 12-bit command length field.

FIGURE 8-1: COMMAND FORMAT

15 12	11 0
Opcode	Length
Command Data First Word (if required)	
•	
•	
Command Data Last Word (if required)	

The command opcode must match one of those in the command set. Any command that is received which does not match the list in Table 8-1 will return a "NACK" response (see **Section 9.2.1 "Opcode Field"**).

The command length is represented in 16-bit words since the SPI operates in 16-bit mode. The programming executive uses the Command Length field to determine the number of words to read from the SPI port. If the value of this field is incorrect, the command will not be properly received by the programming executive.

8.3 Packed Data Format

When 24-bit instruction words are transferred across the 16-bit SPI interface, they are packed to conserve space using the format shown in Figure 8-2. This format minimizes traffic over the SPI and provides the programming executive with data that is properly aligned for performing table write operations.

FIGURE 8-2: PACKED INSTRUCTION WORD FORMAT

15 8	7 0
lsw1	
MSB2	MSB1
lsw2	

lswx: Least significant 16 bits of instruction word
MSBx: Most Significant Byte of instruction word

Note:	When the number of instruction words transferred is odd, MSB2 is zero and lsw2 cannot be transmitted.

8.4 Programming Executive Error Handling

The programming executive will "NACK" all unsupported commands. Additionally, due to the memory constraints of the programming executive, no checking is performed on the data contained in the Programmer command. It is the responsibility of the programmer to command the programming executive with valid command arguments, or the programming operation may fail. Additional information on error handling is provided in **Section 9.2.3 "QE_Code Field"**.

8.5 Command Descriptions

All commands that are supported by the programming executive are described in **Section 8.5.1 "SCHECK Command"** through **Section 8.5.11 "QVER Command"**.

8.5.1 SCHECK COMMAND

15 12	11 0
Opcode	Length

Field	Description
Opcode	0x0
Length	0x1

The SCHECK command instructs the programming executive to do nothing, but generate a response. This command is used as a "sanity check" to verify that the programming executive is operational.

Expected Response (2 words):
0x1000
0x0002

Note:	This instruction is not required for programming, but is provided for development purposes only.

8.5.2 READD COMMAND

15 12	11 8	7 0
Opcode	Length	
Reserved0	N	
Reserved1		Addr_MSB
Addr_LS		

Field	Description
Opcode	0x1
Length	0x4
Reserved0	0x0
N	Number of 16-bit words to read (max of 2048)
Reserved1	0x0
Addr_MSB	MSB of 24-bit source address
Addr_LS	LS 16 bits of 24-bit source address

The READD command instructs the programming executive to read N 16-bit words of memory starting from the 24-bit address specified by Addr_MSB and Addr_LS. This command can only be used to read 16-bit data. It can be used to read data EEPROM, Configuration registers and the device ID.

Expected Response (2+N words):
0x1100
N + 2
Data word 1
...
Data word N

Note:	Reading unimplemented memory will cause the programming executive to reset.

8.5.7 ERASEB COMMAND

15 12	11 2	0
Opcode	Length	
Reserved		MS

Field	Description
Opcode	0x7
Length	0x2
Reserved	0x0
MS	Select memory to erase: 0x0 = All Code in General Segment 0x1 = All Data EEPROM in General Segment 0x2 = All Code and Data EEPROM in General Segment, interrupt vectors and FGS Configuration register 0x3 = Full Chip Erase 0x4 = All Code and Data EEPROM in Boot, Secure and General Segments, and FBS, FSS and FGS Configuration registers 0x5 = All Code and Data EEPROM in Secure and General Segments, and FSS and FGS Configuration registers 0x6 = All Data EEPROM in Boot Segment 0x7 = All Data EEPROM in Secure Segment

The ERASEB command performs a Bulk Erase. The MS field selects the memory to be bulk erased, with options for erasing Code and/or Data EEPROM in individual memory segments.

When Full Chip Erase is selected, the following memory regions are erased:

- All code memory (even if code-protected)
- All data EEPROM
- All code-protect Configuration registers

Only the executive code memory, Unit ID, device ID and Configuration registers that are not code-protected remain intact after a Chip Erase.

Expected Response (2 words):
0x1700
0x0002

Note:	A Full Chip Erase cannot be performed in low-voltage programming systems (V_{DD} less than 4.5 volts). ERASED and ERASEP must be used to erase code memory, executive memory and data memory. Alternatively, individual Segment Erase operations may be performed.

8.5.8 ERASED COMMAND

15 12	11 8	7 0
Opcode	Length	
Num_Rows		Addr_MSB
Addr_LS		

Field	Description
Opcode	0x8
Length	0x3
Num_Rows	Number of rows to erase (max of 128)
Addr_MSB	MSB of 24-bit base address
Addr_LS	LS 16 bits of 24-bit base address

The ERASED command erases the specified number of rows of data EEPROM from the specified base address. The specified base address must be a multiple of 0x20. Since the data EEPROM is mapped to program space, a 24-bit base address must be specified.

After the erase is performed, all targeted bytes of data EEPROM will contain 0xFF.

Expected Response (2 words):
0x1800
0x0002

Note:	The ERASED command cannot be used to erase the Configuration registers or device ID. Code-protect Configuration registers can only be erased with the ERASEB command, while the device ID is read-only.

11.2.2 REGOUT SERIAL INSTRUCTION EXECUTION

The REGOUT control code allows for data to be extracted from the device in ICSP mode. It is used to clock the contents of the VISI register out of the device over the PGD pin. Once the REGOUT control code is received, eight clock cycles are required to process the command. During this time, the CPU is held idle. After these eight cycles, an additional 16 cycles are required to clock the data out (see Figure 11-3).

The REGOUT instruction is unique because the PGD pin is an input when the control code is transmitted to the device. However, once the control code is processed, the PGD pin becomes an output as the VISI register is shifted out. After the contents of the VISI are shifted out, PGD becomes an input again as the state machine holds the CPU idle until the next 4-bit control code is shifted in.

Note:	Once the contents of VISI are shifted out, the dsPIC® DSC device maintains PGD as an output until the first rising edge of the next clock is received.

FIGURE 11-1: PROGRAM ENTRY AFTER RESET

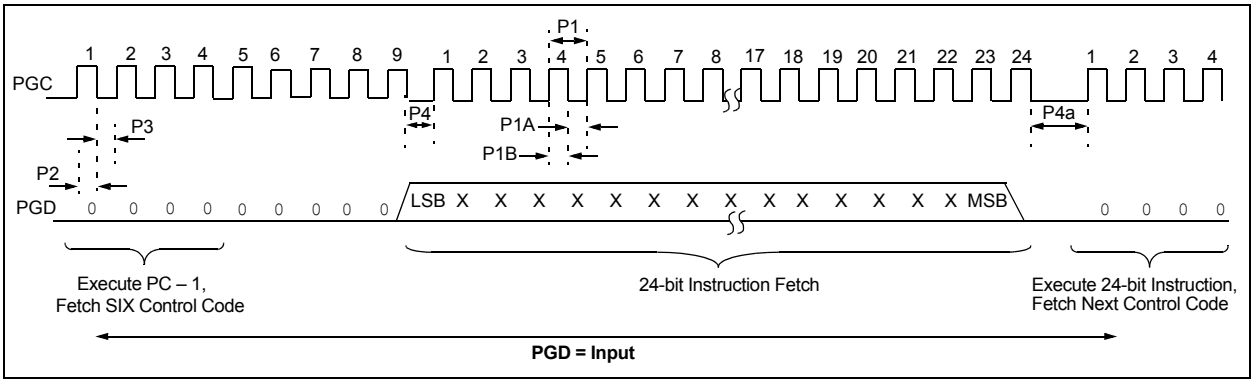


FIGURE 11-2: SIX SERIAL EXECUTION

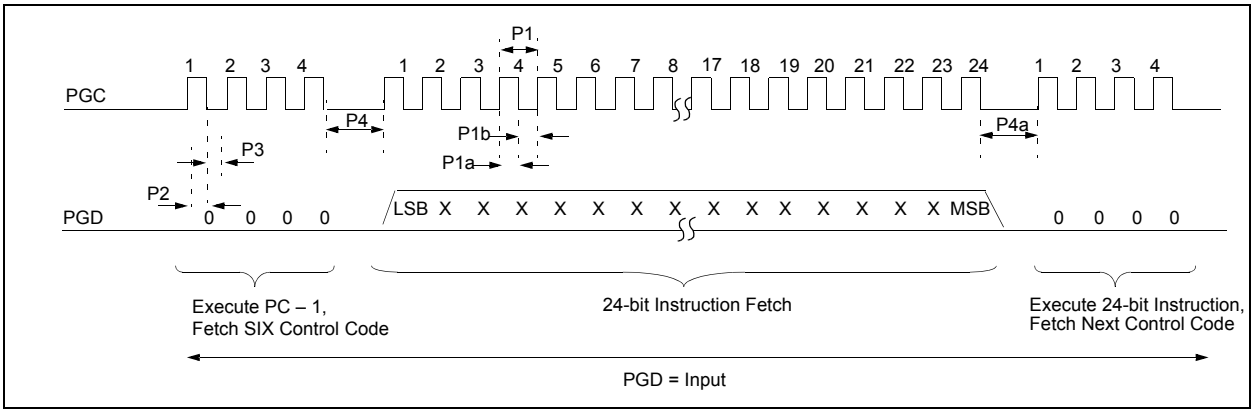

FIGURE 11-3: REGOUT SERIAL EXECUTION

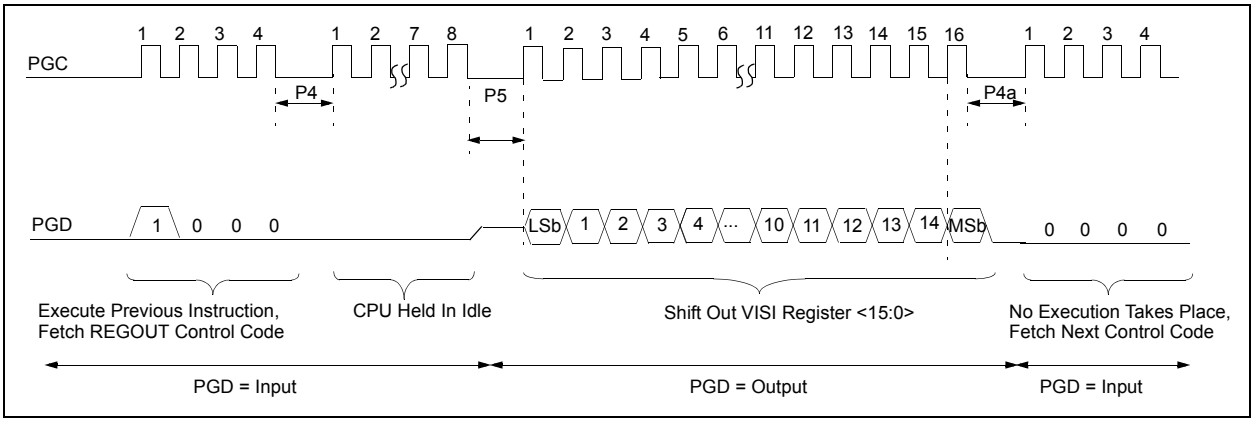

TABLE 11-5: SERIAL INSTRUCTION EXECUTION FOR ERASING PROGRAM MEMORY (EITHER IN LOW-VOLTAGE OR NORMAL-VOLTAGE SYSTEMS) (CONTINUED)

Command (Binary)	Data (Hexadecimal)	Description
Step 6: Update the row address stored in NVMADRU:NVMADR. When W6 rolls over to 0x0, NVMADRU must be incremented.		
0000	430307	ADD W6, W7, W6
0000	AF0042	BTSC SR, #C
0000	EC2764	INC NVMADRU
0000	883B16	MOV W6, NVMADR
Step 7: Reset device internal PC.		
0000	040100	GOTO 0x100
0000	000000	NOP
Step 8: Repeat Steps 3-7 until all rows of code memory are erased.		
Step 9: Initialize NVMADR and NVMADRU to erase executive memory and initialize W7 for row address updates.		
0000	EB0300	CLR W6
0000	883B16	MOV W6, NVMADR
0000	200807	MOV #0x80, W7
0000	883B27	MOV W7, NVMADRU
0000	200407	MOV #0x40, W7
Step 10: Set NVMCON to erase 1 row of executive memory.		
0000	24071A	MOV #0x4071, W10
0000	883B0A	MOV W10, NVMCON
Step 11: Unlock the NVMCON to erase 1 row of executive memory.		
0000	200558	MOV #0x55, W8
0000	883B38	MOV W8, NVMKEY
0000	200AA9	MOV #0xAA, W9
0000	883B39	MOV W9, NVMKEY
Step 12: Initiate the erase cycle.		
0000	A8E761	BSET NVMCON, #WR
0000	000000	NOP
0000	000000	NOP
—	—	Externally time 'P13a' ms (see **Section 13.0 "AC/DC Characteristics and Timing Requirements"**)
0000	000000	NOP
0000	000000	NOP
0000	A9E761	BCLR NVMCON, #WR
0000	000000	NOP
0000	000000	NOP
Step 13: Update the row address stored in NVMADR.		
0000	430307	ADD W6, W7, W6
0000	883B16	MOV W6, NVMADR
Step 14: Reset device internal PC.		
0000	040100	GOTO 0x100
0000	000000	NOP
Step 15: Repeat Steps 10-14 until all 24 rows of executive memory are erased.		
Step 16: Initialize NVMADR and NVMADRU to erase data memory and initialize W7 for row address updates.		
0000	2XXXX6	MOV #<lower 16-bits of starting Data EEPROM address>, W6
0000	883B16	MOV W6, NVMADR
0000	2007F6	MOV #0x7F, W6
0000	883B16	MOV W6, NVMADRU
0000	200207	MOV #0x20, W7
Step 17: Set NVMCON to erase 1 row of data memory.		
0000	24075A	MOV #0x4075, W10
0000	883B0A	MOV W10, NVMCON

11.9 Writing Data EEPROM

The procedure for writing data EEPROM is very similar to the procedure for writing code memory, except that fewer words are programmed in each operation. When writing data EEPROM, one row of data EEPROM is programmed at a time. Each row consists of sixteen 16-bit data words. Since fewer words are programmed during each operation, only working registers W0:W3 are used as temporary holding registers for the data to be programmed.

Table 11-9 shows the ICSP programming details for writing data EEPROM. Note that a different NVMCON value is required to write to data EEPROM, and that the TBLPAG register is hard-coded to 0x7F (the upper byte address of all locations of data EEPROM).

TABLE 11-9: SERIAL INSTRUCTION EXECUTION FOR WRITING DATA EEPROM

Command (Binary)	Data (Hexadecimal)	Description
Step 1: Exit the Reset vector.		
0000	040100	GOTO 0x100
0000	040100	GOTO 0x100
0000	000000	NOP
Step 2: Set the NVMCON to write 16 data words.		
0000	24005A	MOV #0x4005, W10
0000	883B0A	MOV W10, NVMCON
Step 3: Initialize the write pointer (W7) for TBLWT instruction.		
0000	2007F0	MOV #0x7F, W0
0000	880190	MOV W0, TBLPAG
0000	2xxxx7	MOV #<DestinationAddress15:0>, W7
Step 4: Load W0:W3 with the next 4 data words to program.		
0000	2xxxx0	MOV #<WORD0>, W0
0000	2xxxx1	MOV #<WORD1>, W1
0000	2xxxx2	MOV #<WORD2>, W2
0000	2xxxx3	MOV #<WORD3>, W3
Step 5: Set the read pointer (W6) and load the (next set of) write latches.		
0000	EB0300	CLR W6
0000	000000	NOP
0000	BB1BB6	TBLWTL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BB1BB6	TBLWTL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BB1BB6	TBLWTL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BB1BB6	TBLWTL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
Step 6: Repeat steps 4-5 four times to load the write latches for 16 data words.		

11.10 Reading Code Memory

Reading from code memory is performed by executing a series of TBLRD instructions and clocking out the data using the REGOUT command. To ensure efficient execution and facilitate verification on the programmer, four instruction words are read from the device at a time.

Table 11-10 shows the ICSP programming details for reading code memory. In Step 1, the Reset vector is exited. In Step 2, the 24-bit starting source address for reading is loaded into the TBLPAG and W6 registers. The upper byte of the starting source address is stored to TBLPAG, while the lower 16 bits of the source address are stored to W6.

To minimize the reading time, the packed instruction word format that was utilized for writing is also used for reading (see Figure 11-5). In Step 3, the write pointer W7 is initialized, and four instruction words are read from code memory and stored to working registers W0:W5. In Step 4, the four instruction words are clocked out of the device from the VISI register using the REGOUT command. In Step 5, the internal PC is reset to 0x100, as a precautionary measure, to prevent the PC from incrementing into unimplemented memory when large devices are being read. Lastly, in Step 6, Steps 3-5 are repeated until the desired amount of code memory is read.

TABLE 11-10: SERIAL INSTRUCTION EXECUTION FOR READING CODE MEMORY

Command (Binary)	Data (Hexadecimal)	Description
Step 1: Exit the Reset vector.		
0000	040100	GOTO 0x100
0000	040100	GOTO 0x100
0000	000000	NOP
Step 2: Initialize TBLPAG and the read pointer (W6) for TBLRD instruction.		
0000	200xx0	MOV #<SourceAddress23:16>, W0
0000	880190	MOV W0, TBLPAG
0000	2xxxx6	MOV #<SourceAddress15:0>, W6
Step 3: Initialize the write pointer (W7) and store the next four locations of code memory to W0:W5.		
0000	EB0380	CLR W7
0000	000000	NOP
0000	BA1B96	TBLRDL [W6], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BADBB6	TBLRDH.B [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BADBD6	TBLRDH.B [++W6], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BA1BB6	TBLRDL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BA1B96	TBLRDL [W6], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BADBB6	TBLRDH.B [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BADBD6	TBLRDH.B [++W6], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BA0BB6	TBLRDL [W6++], [W7]
0000	000000	NOP
0000	000000	NOP

TABLE 11-10: SERIAL INSTRUCTION EXECUTION FOR READING CODE MEMORY (CONTINUED)

Command (Binary)	Data (Hexadecimal)	Description
Step 4: Output W0:W5 using the VISI register and REGOUT command.		
0000	883C20	MOV W0, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C21	MOV W1, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C22	MOV W2, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C23	MOV W3, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C24	MOV W4, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C25	MOV W5, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
Step 5: Reset the device internal PC.		
0000	040100	GOTO 0x100
0000	000000	NOP
Step 6: Repeat steps 3-5 until all desired code memory is read.		

11.11 Reading Configuration Memory

The procedure for reading configuration memory is similar to the procedure for reading code memory, except that 16-bit data words are read instead of 24-bit words. Since there are seven Configuration registers, they are read one register at a time.

Table 11-11 shows the ICSP programming details for reading all of the configuration memory. Note that the TBLPAG register is hard-coded to 0xF8 (the upper byte address of configuration memory), and the read pointer W6 is initialized to 0x0000.

TABLE 11-11: SERIAL INSTRUCTION EXECUTION FOR READING ALL CONFIGURATION MEMORY

Command (Binary)	Data (Hexadecimal)	Description
Step 1: Exit the Reset vector.		
0000	040100	GOTO 0x100
0000	040100	GOTO 0x100
0000	000000	NOP
Step 2: Initialize TBLPAG, and the read pointer (W6) and the write pointer (W7) for TBLRD instruction.		
0000	200F80	MOV #0xF8, W0
0000	880190	MOV W0, TBLPAG
0000	EB0300	CLR W6
0000	EB0380	CLR W7
0000	000000	NOP
Step 3: Read the Configuration register and write it to the VISI register (located at 0x784).		
0000	BA0BB6	TBLRDL [W6++], [W7]
0000	000000	NOP
0000	000000	NOP
0000	883C20	MOV W0, VISI
0000	000000	NOP
Step 4: Output the VISI register using the REGOUT command.		
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
Step 5: Reset device internal PC.		
0000	040100	GOTO 0x100
0000	000000	NOP
Step 6: Repeat steps 3-5 six times to read all of configuration memory.		

11.12 Reading Data Memory

The procedure for reading data memory is similar to that of reading code memory, except that 16-bit data words are read instead of 24-bit words. Since less data is read in each operation, only working registers W0:W3 are used as temporary holding registers for the data to be read.

Table 11-12 shows the ICSP programming details for reading data memory. Note that the TBLPAG register is hard-coded to 0x7F (the upper byte address of all locations of data memory).

TABLE 11-12: SERIAL INSTRUCTION EXECUTION FOR READING DATA MEMORY

Command (Binary)	Data (Hexadecimal)	Description
Step 1: Exit the Reset vector.		
0000	040100	GOTO 0x100
0000	040100	GOTO 0x100
0000	000000	NOP
Step 2: Initialize TBLPAG and the read pointer (W6) for TBLRD instruction.		
0000	2007F0	MOV #0x7F, W0
0000	880190	MOV W0, TBLPAG
0000	2xxxx6	MOV #<SourceAddress15:0>, W6
Step 3: Initialize the write pointer (W7) and store the next four locations of code memory to W0:W5.		
0000	EB0380	CLR W7
0000	000000	NOP
0000	BA1BB6	TBLRDL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BA1BB6	TBLRDL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BA1BB6	TBLRDL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BA1BB6	TBLRDL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
Step 4: Output W0:W5 using the VISI register and REGOUT command.		
0000	883C20	MOV W0, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C21	MOV W1, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C22	MOV W2, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
0000	883C23	MOV W3, VISI
0000	000000	NOP
0001	<VISI>	Clock out contents of VISI register
0000	000000	NOP
Step 5: Reset device internal PC.		
0000	040100	GOTO 0x100
0000	000000	NOP
Step 6: Repeat steps 3-5 until all desired data memory is read.		

12.2 Programming Verification

After the programming executive has been programmed to executive memory using ICSP, it must be verified. Verification is performed by reading out the contents of executive memory and comparing it with the image of the programming executive stored in the programmer.

Reading the contents of executive memory can be performed using the same technique described in **Section 11.10 "Reading Code Memory"**. A procedure for reading executive memory is shown in Table 12-2. Note that in Step 2, the TBLPAG register is set to 0x80 such that executive memory may be read.

TABLE 12-2: READING EXECUTIVE MEMORY

Command (Binary)	Data (Hexadecimal)	Description
Step 1: Exit the Reset vector.		
0000	040100	GOTO 0x100
0000	040100	GOTO 0x100
0000	000000	NOP
Step 2: Initialize TBLPAG and the read pointer (W6) for TBLRD instruction.		
0000	200800	MOV #0x80, W0
0000	880190	MOV W0, TBLPAG
0000	EB0300	CLR W6
Step 3: Initialize the write pointer (W7), and store the next four locations of executive memory to W0:W5.		
0000	EB0380	CLR W7
0000	000000	NOP
0000	BA1B96	TBLRDL [W6], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BADBB6	TBLRDH.B [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BADBD6	TBLRDH.B [++W6], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BA1BB6	TBLRDL [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BA1B96	TBLRDL [W6], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BADBB6	TBLRDH.B [W6++], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BADBD6	TBLRDH.B [++W6], [W7++]
0000	000000	NOP
0000	000000	NOP
0000	BA1BB6	TBLRDL [W6++], [W7]
0000	000000	NOP
0000	000000	NOP

TABLE 12-2: READING EXECUTIVE MEMORY (CONTINUED)

Command (Binary)	Data (Hexadecimal)	Description
Step 4: Output W0:W5 using the VISI register and REGOUT command.		
0000	883C20	MOV W0, VISI
0000	000000	NOP
0001	—	Clock out contents of VISI register
0000	883C21	MOV W1, VISI
0000	000000	NOP
0001	—	Clock out contents of VISI register
0000	883C22	MOV W2, VISI
0000	000000	NOP
0001	—	Clock out contents of VISI register
0000	883C23	MOV W3, VISI
0000	000000	NOP
0001	—	Clock out contents of VISI register
0000	883C24	MOV W4, VISI
0000	000000	NOP
0001	—	Clock out contents of VISI register
0000	883C25	MOV W5, VISI
0000	000000	NOP
0001	—	Clock out contents of VISI register
Step 5: Reset the device internal PC.		
0000	040100	GOTO 0x100
0000	000000	NOP
Step 6: Repeat Steps 3-5 until all 736 instruction words of executive memory are read.		

TABLE 13-1: AC/DC CHARACTERISTICS (CONTINUED)

AC/DC CHARACTERISTICS			Standard Operating Conditions (unless otherwise stated) Operating Temperature: 25° C is recommended			
Param. No.	**Sym**	**Characteristic**	**Min**	**Max**	**Units**	**Conditions**
P9b	TDLY5	Delay between PGD ↓by programming executive to PGD released by programming executive	15	—	µs	—

P13a	TERA	Bulk/Row Erase cycle time	1	4	ms	ICSP mode
P13b	TERA	Bulk/Row Erase cycle time	0.8	2.6	ms	Enhanced ICSP mode

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
ISO/TS 16949:2002

Microchip received ISO/TS-16949:2002 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
